**Description:** Sets the signal source for the digital output DO 0 (X542.1, X542.2, X542.3) of Terminal Module 31 (TM31). Digital output 0 of TM31 is a relay output.

If the signal at the binector input p4030 is low, then terminal COM 0 (X542.2) is connected to NC 0 (X542.1). This connection also matches the mechanical quiescent setting of the relay.

If the signal at the binector input p4030 is high, then terminal COM 0 (X542.2) is connected to NO 0 (X542.3).

**Note:** DO: Digital Output

NC: Normally Closed contact

NO: Normally Open contact

**Description:** Sets the limit for the total output voltage of terminals X541.1, X541.2, X541.3 and X541.4 (DI/DO 8 ... 11) of Terminal Module 31 (TM31).

**Value:** 0: 0.1 A total current limit DI/DO 8 ... 11  
1: 1.0 A total current limit DI/DO 8 ... 11

**Dependency:** Refer to: p4028

**Warning:** Since the sum of the output currents at terminals X541.1, X541.2, X541.3 and X541.4 is limited, an overcurrent or short circuit at one output terminal can cause a dip in the signal at the other terminals.

<b>Description:</b>	Sets the type of analog inputs of Terminal Module 31 (TM31). p4056[x] = 0, 4 correspond to a voltage input (r4052, p4057, p4059 are displayed in V). p4056[x] = 2, 3, 5 correspond to a current input (r4052, p4057, p4059 are displayed in mA). In addition, the associated switch S5 must be appropriately set. AI 0: S5.0 = V --> voltage input, S5.0 = I --> current input (burden resistor = 250 Ohm) AI 1: S5.1 = V --> voltage input, S5.1 = I --> current input (burden resistor = 250 Ohm)		
<b>Value:</b>	0: Unipolar voltage input (0 V ... +10 V) 2: Unipolar current input (0 mA ... +20 mA) 3: Unipolar current input monitored (+4 mA to +20 mA) 4: Bipolar voltage input (-10 V ... +10 V) 5: Bipolar current input (-20 mA to +20 mA)

<b>Warning:</b>	The maximum voltage difference between the analog input terminals AI+, AI- and the ground of the TM31 (X520.6, X530.3) may not exceed 35 V.		
	For operation with the load resistor switched in, the voltage between the differential inputs AI+ and AI- may not exceed 15 V or the impressed current of 60 mA; if this is not carefully observed, the input will be damaged.		
<b>Notice:</b>	For operation as a voltage input/current input, switch S5.0 or S5.1 must be appropriately set.		
<b>Note:</b>	When changing p4056, the parameters of the scaling characteristic (p4057, p4058, p4059, p4060) are overwritten with the following default values: For p4056 = 0, 4, p4057 is set to 0.0 V, p4058 to 0.0 %, p4059 to 10.0 V and p4060 to 100.0 %. For p4056 = 2, 5, p4057 is set to 0.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %. For p4056 = 3, p4057 is set to 4.0 mA, p4058 to 0.0 %, p4059 to 20.0 mA and p4060 to 100.0 %.

<b>Dependency:</b>	The parameter can only be modified for p0009 = 3, 29. The following applies for the sampling time: The sampling times at a DRIVE-CLiQ line must be integral multiples of one another. The sampling times of this TM must be an integral multiple of a servo or vector drive that exists in the system. The minimum permissible sampling time is 125 µs. The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs). **Note:** The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).  
Parameter p4099[0] must never be equal to zero.

**Description:** Sets the sampling time for the inputs and outputs of Terminal Board 30 (TB30).

**Index:** [0] = Digital inputs/outputs (DI/DO)  
[1] = Analog inputs (AI)  
[2] = Analog outputs (AO)

**Dependency:** The parameter can only be modified for p0009 = 3, 29.  
The sampling times can only be set as an integer multiple of the lowest basic sampling time (r0110[0]).  
Refer to: p0009, r0110, r0111

**Note:** The changed sampling time is immediately effective after a completed sub-boot (p0009 -> 0).  
For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. analog/digital converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is switched off. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

**Description:** Sets the delay time for the output of the fault for the Terminal Module 150 (TM150).  
 The timer is started when the alarm threshold (e.g. p4102[0]) is exceeded.  
 If the delay time has expired and the alarm threshold has, in the meantime, not been fallen below, then the corresponding fault is output.  
 The fault can be acknowledged, if, after the delay time has expired, the alarm threshold is again fallen below.  
 For sensor type "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6) the following applies:  
 - if the fault threshold (e.g. p4102[1]) is exceeded before the delay time has expired, then the corresponding fault is immediately output.  
 For sensor type "PTC thermistor", "Bimetallic NC contact" (p4100[0...11] = 1, 4), the following applies:  
 - Alarm and fault threshold simultaneously respond. The fault is only issued after the delay time has expired.

**Description:** Setting to start the measurement of the wire resistance for a channel for the Terminal Module 150 (TM150).  
 For a 2 wire evaluation, the total wire resistance is measured and saved. During the temperature evaluation, the temperature actual value is automatically calibrated using the measured wire resistance.  
 Procedure:  
 1. Select the measuring method (1x2/2x2) for the corresponding terminal block (p4108[0...5] = 0, 1).  
 2. Set the required sensor type for the corresponding channel (p4100[x] = 1 ... 6, x = 0...5 or 0...11).  
 3. Jumper the sensor to be connected (short-circuit the sensor cable close to the sensor).  
 4. Connect the sensor conductors to the appropriate terminals 1(+), 2(-) or 3(+), 4(-).  
 5. For the corresponding channel, start the measurement of the wire resistance (p4109[x] = 1).  
 6. After p4109[x] = 0, check the measured resistance value in p4110[x].  
 7. Remove the jumper across the temperature sensor.

**Notice:**

Wire resistance measurement is only possible for 1x2 or 2x2 wire evaluation (p4108[0...5] = 0, 1).

**Note:**

The wire resistance value can be also directly entered into p4110[0...11].

The automatic conductor calibration for 1x2 and 2x2 wire evaluation is always performed with the value in p4110[0...11].

- "KTY84", "PT100", "PT1000" (p4100[0...11] = 2, 5, 6), real temperature actual value or alternatively

- "PTC thermistor", "bimetallic NC contact" (p4100[0...11] = 1, 4), fictitious temperature actual value (-50 °C, 250 °C)

If these sensor types are combined within one group, then the calculated values for maximum, minimum and average value will be falsified.

**Note:** Active and inactive temperature channels can be included in one group. However, when calculating the values (r4112, r4113, r4114) only the active temperature channels with valid actual value are taken into account (r4105[0...11] not equal to -300 °C).

<b>Notice:</b>	For bit 06: Setting the bit sets the velocity actual value (r0061) permanently to 0. For bit 13: Setting the bit sets the commutation angle permanently to the commutation angle offset (p0431).				
<b>Note:</b>	For bit 09: A setting of bit = 0 will trigger a fault for the relevant channel if the actual value is invalid. A setting of bit = 1 will trigger an alarm for the relevant channel if the actual value is invalid. For bits 10, 11: If both channels are activated, the actual value is generated from the mean value of both channels. If a channel fails (actual value invalid), it is not included when the mean value is generated. For bit 14: The bit is only evaluated for encoder 1. Otherwise no effect.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0	1000	2

**Description:** Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. The pulse number is corrected if the deviation is less than this limit. If it is higher than this limit, fault F3x131 is triggered.  
If fault F3x131 is re-parameterized to an alarm (A) or no message (N), then the encoder pulses that are not corrected are transferred to the accumulator (p4688). The accumulator can be deactivated using p0437.7.

**Dependency:** Refer to: p0437, p4688  
Refer to: F31131

**Note:** This monitoring is activated by setting p0437.2 = 1 (position actual value correction).  
The positive limit describes additional pulses due to EMC.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	-1001	0	-1001

**Description:** Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. The pulse number is corrected if the deviation is less than this limit. If it is higher than this limit, fault F3x131 is triggered.  
If fault F3x131 is re-parameterized to an alarm (A) or no message (N), then the encoder pulses that are not corrected are transferred to the accumulator (p4688). The accumulator can be deactivated using p0437.7.

**Dependency:** Refer to: p0437, p4681, p4688  
Refer to: F31131

**Note:** This monitoring is activated by setting p0437.2 = 1 (position actual value correction).  
For a set value = -1001, the negated value of p4681 becomes active.  
The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

**Description:**

Setting for the saving/downloading/deletion of motor and/or encoder data for the component specified in p4690 (SMI/DQI).

A backup of this data can be saved to non-volatile memory. The backup procedure is performed automatically as part of the function for saving to non-volatile memory (p0977 = 1 or "Copy RAM to ROM"). If a part is replaced, the saved data can be reloaded.

Procedure:

p4690 = set component number

p4691 = 1, 2, 30: Set the required procedure (save/download/delete).

p4691 = 9, 10, 36: Feedback signal on successful completion of the procedure.

p4691 = 11... 22, 37, 38: Error values if the procedure could not be executed successfully.

**Value:**

0: Inactive  
1: Save SMI data  
2: Download SMI data  
9: SMI data downloaded and POWER ON required for component  
10: SMI data backup complete  
11: SMI data backup for selected component not found  
12: Selected component not available or not connected  
13: Insufficient memory space for backup  
14: Format of saved data is incompatible  
15: Transfer fault during data download  
16: Transfer fault during data backup  
17: Data backup does not match parameterized encoder/motor  
18: Data backup directory not permissible  
19: Component already contains data  
20: Component does not contain any data  
21: Component is not an SMI or a DQI  
22: SMI data cannot be downloaded for component  
30: Delete SMI data  
35: Confirmation of SMI data delete required  
36: SMI data deleted and POWER ON required for component  
37: Access level not sufficient for delete  
38: Delete SMI data not permitted for component  
39: SMI data for component cannot be deleted

**Dependency:**

Refer to: p4690, p4692, p4693

**Notice:**

Once SMI/DQI data has been deleted or downloaded successfully, the component has to be switched on (POWER ON).

**Note:**

**Description:**

Setting to back up the data of all SMIs and DQIs featured in the target topology.

**Value:**

- 0: Inactive
- 1: Save data of all SMIs and DQIs
- 10: Save all data successful
- 13: Insufficient memory space for backup
- 16: Transfer fault during data backup
- 20: Component does not contain any data
- 29: Not all components from target topology saved

**Note:**

SMI: SINAMICS Sensor Module Integrated  
 p4692 = 10: Automatic on successful completion of backup procedure.  
 p4692 = 13, 16, 20, 29: Error values if the procedure could not be executed successfully.  
 The procedure must be repeated if the data save operation was interrupted (e.g. if the power supply voltage failed).  
 Help for error value = 13:  
 - Use a memory card with more memory space.  
 Remedy for fault value = 16:  
 - check the DRIVE-CLiQ wiring.  
 Remedy for fault value = 20:  
 - Use an SMI that is not blank.  
 Help for error value = 29:  
 - check and correct the target and actual topologies for the SMIs.  
 - Repeat the save procedure.

<b>Description:</b>	Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

<b>Description:</b>	Displays the trace buffer (record buffer) for trace 0 and signal 0 as integer number.		
<b>Note:</b>	For signals, data type I32 or U32, the trace buffer is assigned as follows: r4760[0] = value 0 r4760[1] = value 1 ... r4760[8191] = value 8191 For signals, data type I16 or U16, the trace buffer is assigned as follows: r4760[0] = value 1 (bit 31 ... 16) and value 0 (bit 15 ... 0) r4760[1] = value 3 (bit 31 ... 16) and value 2 (bit 15 ... 0) ... r4760[8191] = value 16383 (bit 31 ... 16) and value 16382 (bit 15 ... 0) For signals, data type I8 or U8, the trace buffer is assigned as follows: r4760[0] = value 3 (bit 31 ... 24) value 2 (bit 23 ... 16) value 1 (bit 15 ... 8) value 0 (bit 7 ... 0) r4760[1] = value 7 (bit 31 ... 24) value 6 (bit 23 ... 16) value 5 (bit 15 ... 8) value 4 (bit 7 ... 0) ... r4760[8191] = value 32767 (bit 31 ... 24) value 32766 (bit 23 ... 16) value 32765 (bit 15 ... 8) value 32764 (bit 7 ... 0)

<b>Index:</b>	[0] = Milliseconds [1] = Days		
<b>Dependency:</b>	Refer to: r2114, r3102, r4719		
<b>Notice:</b>	The accuracy of the trigger instant depends on the accuracy of the underlying basis time. For clarification: The trigger instant is calculated with a $\mu$ s accuracy. If the underlying basis time is only available with ms accuracy, then as a result of rounding effects, an inaccuracy of 1 ms can occur. When referred to r4719, the trigger instant can therefore deviate somewhat.		
<b>Note:</b>	If the time calculation of the drive can be synchronized with a higher-level control, then this time can be taken from the actual UTC time (r3102). Otherwise, the time is based on the system runtime (r2114).

## 2 Parameters

### 2.2 List of parameters

<b>Index:</b>	[0] = Trace 0 [1] = Trace 1
<b>Dependency:</b>	Refer to: r4841, p4844 Refer to: A02097, A02098
<b>Notice:</b>	A multiple trace can have a negative impact on the total system performance. From their inherent principle of operation, flash memory cards are subject to wear as a result of write operations. As a consequence, the lifetime of flash memory cards is reduced when using the multiple trace functionality.

<b>Description:</b>	Sets the boost factor for the copper losses at standstill for motor temperature models 1 and 3. The entered factor is active for speed n = 0 [rpm]. This factor is linearly reduced down to 1 between speeds n = 0 ... 1 [rpm].		

The following values are required to calculate the boost factor:

- stall current ( $I_0$ , p0318, catalog value)
- thermal stall current ( $I_{th0}$ , catalog value)

The boost factor is calculated as follows:

$$- p5350 = (I_0 / I_{th0})^2$$

**Dependency:**

Refer to: p0318, p0612, p5390, p5391

Refer to: F07011, A07012, A07014

**Notice:**

When selecting a catalog motor (p0301), this parameter is automatically pre-assigned and is write protected. Information in p0300 should be carefully observed when removing write protection.

**Note:**

Temperature model 1 (I2t):

The following applies for firmware version < 4.7 SP6 or p0612.8 = 0:

- parameter p5350 is not active. Internally, a fixed boost factor of 1.333 is used as basis for the calculation.

The following applies from firmware version 4.7 SP6 and p0612.8 = 1:

- parameter p5350 becomes active as described above.

**Note:**

For bit 00, 04:

The motor temperature is measured using a temperature sensor (p0600, p0601). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 01, 05:

The motor temperature is monitored based on a temperature model (p0612). When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 02:

The encoder temperature is measured using a temperature sensor. When the bit is set, a high temperature is identified, and a corresponding signal is additionally output.

For bit 08:

When reaching the motor temperature alarm threshold, reduction of the maximum current is set as response (p0610 = 1). When the bit is set, reduction of the maximum current is active.

	-20000.00 [rpm]	20000.00 [rpm]	10.00 [rpm]
<b>Description:</b>	Sets the hysteresis of the speed setpoint for rotating field inversion of the stator current in the reverse field exciter.		
<b>Dependency:</b>	Refer to: p1821, p6277		
<b>Caution:</b>	When changing the direction of rotation of the main machine using p1821, it must be checked as to whether the phase sequence of the exciter converter must also be changed.		
			
<b>Note:</b>	The amount of the value entered in the parameter is dynamically limited to the rated speed of the motor. The value 0 is not permissible. The sign of the hysteresis defines the rotating field of the stator current for the reverse field exciter depending on the mechanical direction of rotation. The hysteresis is symmetrical around the value in parameter p6277. The direction of rotation reversal using the sign of p6278 is not taken into account when calculating the slip.

<b>Description:</b>	Sets the phase shift of the second system with respect to the first system for the Motor Module for a 12-pulse gating unit.		
<b>Value:</b>	0: Shift by +30 ° 1: Shift by -30 ° 2: Shift by 0 ° 3: Shift by +90 ° 4: Shift by -90 ° 5: Shift by +120 ° 6: Shift by -120 ° 7: Shift by +150 ° 8: Shift by -150 °		
<b>Dependency:</b>	Refer to: p7003		
<b>Notice:</b>	The parameter is only evaluated if p7003 = 2.		
<b>Note:</b>	For p6397 = 0 the following applies: The second systems leads for a positive direction of rotation. For p6397 = 1 the following applies: The second systems lags for a positive direction of rotation.

<b>Description:</b>	Offset voltage between phases L1 and L2 for the Voltage Sensing Module (VSM). The value is automatically determined with the drive switched-off and stationary when the offset calculation is enabled. The last determined value is saved if the offset calculation is inhibited. If the offset calculation is inhibited, then a fixed value can also be entered here.		
<b>Dependency:</b>	Refer to: p6903		
<b>Note:</b>	Offset calibration is only automatically activated if the resulting motor voltage is less than 1% of the rated voltage.

<b>Description:</b>	Sets the offset mode for voltage actual value sensing. When the mode is enabled (p6903 = 0), for a pulse inhibit for stator and excitation and zero speed, the offset calibration is automatically started. Offset calibration is inhibited when the mode is inhibited (p6903 = 1). The values last determined in p6870 and p6871 are saved. However, they can also be overwritten by a fixed value.		
<b>Value:</b>	0: Offset calculation enabled 1: Offset calculation inhibited		
<b>Dependency:</b>	Refer to: p6870, p6871		
<b>Note:</b>	Offset mode can only be set for actual value sensing functions that are available in the hardware.

<b>Description:</b>	Setting to parameterize the recorder. The recorder supplies up to 64 internal variables (depending on the parameterization). The maximum recording time is 2000 ms. The variables are acquired in the current controller sampling time – and a pretrigger can be set. The values can then be acyclically written to the memory card. The development and system test departments have the software necessary to decode the content.		
<b>Index:</b>	[0] = Enable [1] = Recording time [2] = Pre-trigger time [3] = Output message [4] = Recording factor		
<b>Dependency:</b>	Refer to: A49998		
<b>Note:</b>	For index [0]: Enables or disables the function. p6999[0] = 0 Inhibits the function. p6999[0] = 1 Enables the function. For index [1]: Sets the recording time, [ms]. A maximum of 8000 measuring points can be recorded across all drive objects. 1 measuring point is created in one current controller sampling time. Example: The "Recorder" function module is activated on 4 drive objects. The current controller sampling time (p0115[0]) is 250 µs. --> every drive object can record a maximum of 8000/4 = 2000 measuring points. --> the recording time that can be realized is 2000 * 0.250 ms = 500 ms. Note: - the recording time that can be realized is displayed in r6991[1]. - if the recording time is set too long, then it is automatically reduced to what can be realized.		

For index [2]:

Sets the pretrigger time, [ms].

This time is included in the recording time and cannot be longer than the recording time p6999[1].

Note:

- when the recording time is automatically reduced, the pretrigger time is correspondingly reduced as well.

- the pretrigger time that can be realized is displayed in r6991[2].

For index [3]:

Enables or disables the output of message A49998 when the trigger event is triggered.

For index [4]:

p6999[4] = n, n = 0 ... 4

Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2] 2<sup>n</sup> times, and reduces the number of signals 2<sup>n</sup> times.

Example:

Number of drive objects = 1, p0115[0] = 250 μs, p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4

--> recording time: 2000 ms \* 2<sup>4</sup> = 32 s, pre-trigger time: 1000 ms \* 2<sup>4</sup> = 16 s, number of signals 64/16 = 4.

When setting p6999[4] to 0, the results are as follows:

--> recording time: 2000 ms, pre-trigger time: 1000 ms, number of signals: 64

**Dependency:**

Refer to: r7000

**Caution:**

For a parallel connection, the following applies:

When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.

**Note:**

For motors with separate winding systems (p7003 = 1) it is not possible to inhibit an individual power unit.

p7001 is automatically reset if a power unit is deactivated via p0125 or p0895.

<b>Note:</b>	KHP: Know-How Protection For bit 00: Write protection can be activated/deactivated via p7761 on the Control Unit. For bit 01: The know-how protection can be activated by entering a password (p7766 ... p7768). For bit 02: If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset. For bit 03: Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list. For bit 04: When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1. For bit 05: When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.				

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

KHP: Know-How Protection

For bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

<b>Dependency:</b>	Refer to: p7767, p7768		
<b>Notice:</b>	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. When using the STARTER commissioning tool, the password should be entered using the associated dialogs. The following rules apply when entering the password: - password entry must start with p7766[0]. - no gaps are permissible in the password. - entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).		
<b>Note:</b>	KHP: Know-How Protection When reading, p7766[0...29] = 42 dec (ASCII character = "***") is displayed. Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection. Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated. A product-specific list of these parameters is also available in the corresponding List Manual.

## 2 Parameters

### 2.2 List of parameters

	- CU temperature
	- safety logbook
<b>Value:</b>	0: Inactive
	1: NVRAM data backup to memory card
	2: Import NVRAM data from the memory card
	3: Delete NVRAM data in the device
	10: Error when clearing
	11: Error when backing up, memory card not available
	12: Error when backing up, insufficient memory space
	13: Error when backing up
	14: Error when importing, memory card not available
	15: Error when importing, checksum error
	16: Error when importing, no NVRAM data available
	17: Error when importing

**Notice:** For value = 2, 3:  
These actions are only possible when pulses are inhibited.

**Note:** After the action has been successfully completed, the parameter is automatically set to zero.  
The actions importing and deleting NVRAM data immediately initiate a warm restart.  
If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

**Note:**

In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data is overwritten after more than 5 trigger events.  
The trigger event can be set in p7791.  
By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.

**Description:**

Displays the actual serial number of the memory card.

The individual characters of the serial number are displayed in the ASCII code in the indices.

**Dependency:**

Refer to: p9920, p9921

**Notice:**

An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

**Note:**

Example: displaying the serial number for a memory card:

```
r7843[0] = 49 dec --> ASCII characters = "1" --> serial number, character 1
r7843[1] = 49 dec --> ASCII characters = "1" --> serial number, character 2
r7843[2] = 49 dec --> ASCII characters = "1" --> serial number, character 3
r7843[3] = 57 dec --> ASCII characters = "9" --> serial number, character 4
r7843[4] = 50 dec --> ASCII characters = "2" --> serial number, character 5
r7843[5] = 51 dec --> ASCII characters = "3" --> serial number, character 6
r7843[6] = 69 dec --> ASCII characters = "E" --> serial number, character 7
r7843[7] = 0 dec --> ASCII characters = " " --> serial number, character 8
```

...

r7843[19] = 0 dec --&gt; ASCII characters = " " --&gt; serial number, character 20

r7843[20] = 0 dec

Serial number = 111923E

**Description:**

Displays the version of the firmware stored on the memory medium of the drive device.

Depending on the drive device being used, the memory medium is a memory card, or an internal non-volatile device memory.

**Index:**

[0] = Internal

[1] = External

[2] = Parameter backup

## 2 Parameters

### 2.2 List of parameters

**Note:** For index [0]:  
Displays the internal firmware version (e.g. 04402315).  
This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.  
For index [1]:  
Displays the external firmware version (e.g. 04040000 -> 4.4).  
For automation systems with SINAMICS Integrated this is the runtime version of the automation system.  
For index [2]:  
Displays the internal firmware version of the parameter backup.  
With this CU firmware version, the parameter backup was saved, which was used when powering up.

<b>Description:</b>	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - the drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK - if they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.		
<b>Index:</b>	[0] = Drive object number Control Unit [1] = Drive object number object 1 [2] = Drive object number object 2 [3] = Drive object number object 3 [4] = Drive object number object 4 [5] = Drive object number object 5 [6] = Drive object number object 6 [7] = Drive object number object 7 [8] = Drive object number object 8 [9] = Drive object number object 9 [10] = Drive object number object 10 [11] = Drive object number object 11 [12] = Drive object number object 12 [13] = Drive object number object 13 [14] = Drive object number object 14 [15] = Drive object number object 15 [16] = Drive object number object 16 [17] = Drive object number object 17 [18] = Drive object number object 18		

[19] = Drive object number object 19  
 [20] = Drive object number object 20  
 [21] = Drive object number object 21  
 [22] = Drive object number object 22  
 [23] = Drive object number object 23

**Notice:** This parameter may only be used by qualified service personnel.

**Note:** If the same drive object numbers are used and if the existing drive object numbers in the system are entered incompletely, the content of this parameter is ignored entirely. The behavior as with factory setting will then become effective.

**Description:**

Display or setting of the CANopen Node ID.

The Node ID can be set as follows:

1) Using the address switch on the Control Unit.

--> p8620 can then only be read and displays the selected Node ID.

--> A change only becomes effective after a POWER ON.

--> CANopen Node ID and PROFIBUS address are identical.

- 2) Using p8620  
 --> Only if address 0 is set using the address switch.  
 --> the Node ID is set as standard to 126.  
 --> A change only becomes effective after save and POWER ON.

**Dependency:**

Refer to: r8621

**Note:**

Every node ID change only becomes effective after a POWER ON.

The active node ID is displayed in r8621.

The parameter is not influenced by setting the factory setting.

It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

**Dependency:** Refer to: p2100, p2101  
Refer to: F08700

**Note:** When the factory setting is changed, the fault response of fault F08700 is written to p2100 and p2101. In this particular case it is not possible to change the message type using p2118 and p2119.

For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

<b>Note:</b>	The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer. For SINAMICS S120 with CBC10, the PZD interface IF2 is used: BI: p0840.0 = r889x.0 BI: p0844.0 = r889x.1 BI: p0848.0 = r889x.2 BI: p0852.0 = r889x.3 BI: p2103.0 = r889x.7 For SINAMICS S110, the PZD interface IF1 is used: BI: p0840.0 = r209x.0 BI: p0844.0 = r209x.1 BI: p0848.0 = r209x.2 BI: p0852.0 = r209x.3 BI: p2103.0 = r209x.7 The write access is rejected if a CANopen control word is not mapped at one of these locations. ## 2 Parameters

### 2.2 List of parameters

<b>p8837</b>	<b>IF2 STW1.10 = 0 mode / IF2 STW1.10=0</b>		
VECTOR_G, B_INF, ENC	<b>Can be changed:</b> T <b>Data type:</b> Integer16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> 2	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 2
<b>Description:</b>	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control word 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.		
<b>Value:</b>	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints		
<b>Recommendation:</b>	Do not change the setting p2037 = 0.		
<b>Note:</b>	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.		
<b>p8839[0...1]</b>	<b>PZD interface hardware assignment / PZD IF HW assign</b>

<b>Description:</b>	Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).		
<b>Value:</b>	0: Inactive 1: Control Unit onboard 2: COMM BOARD 99: Automatic		
<b>Index:</b>	[0] = Interface 1 [1] = Interface 2		
<b>Dependency:</b>	Refer to: p2030, p8815		
<b>Note:</b>	For value = 99 (automatic) the following applies: - if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1. - if a CBE20 is inserted, then the following applies: -- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2. -- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2. - CAN CBC10 always communicates via IF2. For a value not equal to 99 (automatic) the following applies: - both indices must be set to a number not equal to 99 (automatic). A change only becomes effective after POWER ON, reset or download.		
<b>p8840</b>	<b>COMM BOARD monitoring time / CB t_monit</b>		
CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	<b>Can be changed:</b> U, T <b>Data type:</b> FloatingPoint32 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0 [ms]	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> 65535000 [ms]	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 20 [ms]
<b>Description:</b>	Sets the monitoring time to monitor the process data received via COMM BOARD. If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.		

**Dependency:** Refer to: p8835

**Note:** This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus.  
For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4, 5).  
For CBE20 firmware version Modbus TCP (p8835 =5) then the fieldbus data traffic is also monitored.  
Value = 0: Monitoring is deactivated.

### p8841[0...239] COMM BOARD send configuration data / CB s config\_dat

CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> 65535	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
---	--	--	---

**Description:** Sets the send configuration data for the COMM BOARD.  
The setting is activated with p8842.

**Dependency:** Refer to: p8842

**Note:** The configuration data are specific to the inserted COMM BOARD.  
For CBE20, the configuration data are not relevant.

### p8842 Activate COMM BOARD send configuration / CB s config act

CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	<b>Can be changed:</b> U, T <b>Data type:</b> Unsigned16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> 1	<b>Access level:</b> 3 <b>Func. diagram:</b> 2199, 2200 <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> 0
---	--	--	--

**Description:** Activate a modified send configuration for COMM BOARD.  
With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.

**Dependency:** Refer to: p8841

**Note:** For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted.  
For CBE20, the parameter is only active for firmware selection "SINAMICS Link" (p8835 = 3).

CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	<b>Can be changed:</b> - <b>Data type:</b> Integer16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> 0	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> 255	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -
---	--	--	---

**Description:** Status display for COMM BOARD.

**Value:**

- 0: No initialization
- 1: Fatal fault
- 2: Initialization
- 3: Send configuration
- 4: Receive configuration
- 5: Non-cyclic communication
- 6: Cyclic communications but no setpoints (stop/no clock cycle)
- 255: Cyclic communication

**Note:** For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3).  
For firmware version "PROFINET Device" or "EtherNet/IP" (p8835 = 1, 4), parameter p8956 should be observed.

### r8858[0...39] COMM BOARD read diagnostics channel / CB diag\_chan read

CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	<b>Can be changed:</b> - <b>Data type:</b> Unsigned16 <b>P-Group:</b> Communications <b>Not for motor type:</b> - <b>Min</b> -	<b>Calculated:</b> - <b>Dyn. index:</b> - <b>Unit group:</b> - <b>Scaling:</b> - <b>Max</b> -	<b>Access level:</b> 3 <b>Func. diagram:</b> - <b>Unit selection:</b> - <b>Expert list:</b> 1 <b>Factory setting</b> -

**Description:** Displays the COMM BOARD diagnostics data.

**Note:** The display depends on the COMM BOARD being used.

For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4).

Example for CBE20:

r8858[0] = 4201 --> Siemens CBE20

r8858[1] = 3 --> firmware version = SINAMICS Link (see p8835)

r8858[2 ... 39] --> only for internal Siemens diagnostics.

#### Description:

Assigns a PZD to a telegram word in the SINAMICS Link send telegram.

For p8839[0] = 2 (COMM BOARD via interface 1), the following applies:

- p8871[index] assigns PZD p2051[index].

For p8839[1] = 2 (COMM BOARD via interface 2), the following applies:

- p8871[index] assigns PZD p8851[index].

**Index:** [0] = Controller 1  
[1] = Controller 2

**Dependency:** Refer to: r8961, r8962

**Note:** The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).

For PROFINET, the following applies:

For two connections (Shared Device or system redundancy) the display in the index depends on the sequence in which the connections are established.

The IP addresses of controllers 1 and 2 are displayed in r8961 and r8962.

The following states are displayed for system redundancy:

Primary controller: r8936[x] = 13

Backup controller: r8936[x] = 11

If value = 10:

If the connection remains in this state, then when using PROFINET IRT the following can apply:

- topology error (incorrect port assignment).
- synchronization missing.

For EtherNet/IP, the following applies:

Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

**Description:** Display for the cyclic connection diagnostics.

**Index:** [0] = Number of cyclic connections  
[1] = Number of send subslots of all connections  
[2] = Number of send net data (bytes) of all connections  
[3] = Number of receive subslots of all connections  
[4] = Number of receive net data (bytes) of all connections  
[5] = Connection type (RT, IRT)

**Note:** The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).

For PROFINET, the following applies:

For index [5]:

Bit 0 = 1: there is at least one RT connection.

Bit 1 = 1: there is an IRT connection.

For EtherNet/IP, the following applies:

For index [1, 3, 5]:

These indices are not relevant.

<b>Note:</b>	For CBE20, the parameter is only valid for firmware version "PROFINET Device" (p8835 = 1), "EtherNet/IP" (p8835 = 4) or "MODBUS TCP" (p8835 = 5). Otherwise, it is locked. This restriction is not applicable for the CBE25. When a project is downloaded, the interface configuration is only activated if parameter p8945 is set = 1 or 2 in the offline project. For p8945 = 1: The interface configuration (p8940 and following) is activated. For p8945 = 2: The interface configuration (p8940 and following) is activated - and is saved in a non-volatile fashion (retentively). For p8945 = 3: All storage locations for the interface configuration are restored to the factory setting. The factory setting of the interface configuration is loaded when activated (p8945 = 1) or with the next POWER ON.

**Description:** Sets the modulo value in degrees for rotary axes of the "Safe position" function.

This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.

The value should be set, so that it is precisely at  $2^n$  revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.

The modulo function is deactivated for a value = 0.

**Dependency:** Refer to: F01681

**Notice:** When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** SLP: Safely-Limited Position

SP: Safe Position

<b>Dependency:</b>	Refer to: C01711			
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
<b>Note:</b>	For bit 00: When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.			
	For bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.			
	For bit 02: This bit defines the type of motor, which the sensorless actual value sensing evaluates.			
	For bit = 0, the actual velocity is calculated for an induction motor.			
	For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.			
	Bit = 0 should be set if no motor is defined (p0300 = 0).			
	For bit 03: When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.			
	SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)			
	For bit 05: This bit defines the type of modulation, which the sensorless actual value sensing evaluates.			
	For bit = 0, the actual velocity is calculated for space vector modulation.			
	For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

## 2 Parameters

### 2.2 List of parameters

- Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
For bit 00:  
If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.
- Note:** SDI: Safe Direction (safe motion direction)  
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)  
For bit 00:  
For bit = 1 and with the SSM safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.  
For bit = 0 and with the SSM safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.  
For bit 08:  
For bit = 1 and with the SDI safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.  
For bit = 0 and with the SDI safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

	0.0000 [µs]	25000.0000 [µs]	0.0000 [µs]

- Description:** Sets the clock cycle time of the actual value sensing for safe motion monitoring.  
Setting criteria if the motion monitoring functions are executed with an encoder.  
- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.  
- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.  
- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.  
Setting criteria if the motion monitoring functions are executed without an encoder:  
- the actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115[0]).  
For SINAMICS S120M, the following applies:  
Only setting p9311 = 0 or 2 ms is possible (a value of 0 is internally assumed to be 2).

- Dependency:** Refer to: p0115, p9300, p9511  
Refer to: F01652

- Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.
- Note:** The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).  
The monitoring clock cycle from p9300 must be an integer multiple of this parameter.  
In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.  
The clock cycle time of the actual value sensing should not be set to more than 8 ms.  
A change only becomes effective after a POWER ON.

<b>Description:</b>	Sets the factor to increase the tolerance for the data cross-check of the actual position between the two monitoring channels while the gearbox stage is being switched over. This factor is effective when actual value synchronization is activated and when deactivated. Depending on the following tolerance, the following is obtained: - actual value synchronization activated: p9549 * p9543 - actual value synchronization deactivated: p9542 * p9543

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [µs]	500000.00 [µs]	0.00 [µs]

**Description:** Sets the filter time for the SSM feedback signal to detect standstill ( $n < nx$ ).

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The filter time is effective only if the function is enabled ( $p9301.16 = p9501.16 = 1$ ).

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

The parameter is included in the data cross-check of the two monitoring channels.

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [mm/min]	1000000.00 [mm/min]	20.00 [mm/min]

**Description:** Sets the velocity limit for the SSM feedback signal to detect standstill ( $n < nx$ ).

When this limit value is undershot, the signal "SSM feedback signal active" is set.

For  $p9368 = p9568 = 0$ , the value in  $p9346/p9546$  is also applicable for SAM/SBR.

**Dependency:** Refer to: p9546

**Caution:** The "SAM/SBR" function is deactivated if the selected threshold value is undershot.

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** SAM: Safe Acceleration Monitor (safe acceleration monitoring)

SBR: Safe Brake Ramp (safe brake ramp monitoring)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

**Description:** Sets the velocity limit for the SSM feedback signal to detect standstill ( $n < nx$ ).

When this limit value is undershot, the signal "SSM feedback signal active" is set.

For p9368 = p9568 = 0, the value in p9346/p9546 is also applicable for SAM/SBR.

**Dependency:** Refer to: p9546

**Caution:** The "SAM/SBR" function is deactivated if the selected threshold value is undershot.

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

	-1	4	-1	
<b>Description:</b>	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.			
<b>Dependency:</b>	Refer to: p9507 Refer to: F30681, C30711			
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can have a negative impact on the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).			
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

<b>Caution:</b>	The safety functionality is only completely guaranteed after this time has expired.			
				
<b>Notice:</b>	This parameter is overwritten by the copy function of the safety functions integrated in the drive. ## 2 Parameters

### 2.2 List of parameters

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  
The smoothing is realized with a 1st order lowpass filter  
For p9387 = minimum value, the filter is deactivated.  
The set time is rounded internally to an integer multiple of the monitoring clock cycle.

#### **p9388 SI Motion actual value sensing sensorless minimum current (MM) / ActVal sl I\_min MM**

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [%]	1000.00 [%]	10.00 [%]

**Description:** Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).  
- the value must be increased if C30711 has occurred with message value 1042.  
- the value must be decreased if C30711 has occurred with message value 1041.  
For synchronous motors, the following condition must be fulfilled:  
 $|p0305 \times p9783| \geq p9388 \times 1.2$

**Recommendation:** If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

**Dependency:** Refer to: r9785  
Refer to: C30711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.  
If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

---

#### **p9389 SI Motion actual value sensing sensorless accel. limit (MM) / ActVal sl a\_lim MM**

VECTOR_G	<b>Can be changed:</b> C2(95)	<b>Calculated:</b> -	<b>Access level:</b> 3
	<b>Data type:</b> FloatingPoint32	<b>Dyn. index:</b> -	<b>Func. diagram:</b> -
	<b>P-Group:</b> Safety Integrated	<b>Unit group:</b> -	<b>Unit selection:</b> -
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	10.00 [%]	3300.00 [%]	100.00 [%]

**Description:** Sets the acceleration limit to filter velocity fluctuations.  
If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.  
If this value is decreased, and this dampens the velocity peaks when accelerating.  
- the value must be increased if C30711 with message value 1043 has occurred.  
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

**Recommendation:** The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.  
To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

**Dependency:** Refer to: r9784  
Refer to: C30711

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).  
For p9389 = maximum value, the filter is deactivated.  
Diagnostics parameter p9784 must be used to correctly set this parameter.

**Description:** Sets the modulo value in degrees for rotary axes of the "Safe position" function.  
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.  
The value should be set, so that it is precisely at  $2^n$  revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.  
The modulo function is deactivated for a value = 0.

**Dependency:** Refer to: p9501  
Refer to: F01681

**Notice:** When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

**Note:** SLP: Safely-Limited Position  
SP: Safe Position

	06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-
<b>Dependency:</b>	Refer to: C01711				
<b>Note:</b>	For bit 00: When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.				
	For bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.				
	For bit 02: This bit defines the type of motor, which the sensorless actual value sensing evaluates. For bit = 0, the actual velocity is calculated for an induction motor. For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300. Bit = 0 should be set if no motor is defined (p0300 = 0).				
	For bit 03: When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated. SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)				
	For bit 05: This bit defines the type of modulation, which the sensorless actual value sensing evaluates. For bit = 0, the actual velocity is calculated for space vector modulation. For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.				
	For bit 06: For the automatic test stop, the test stop can still be initiated via binector input p9705. The automatic test stop is executed after power up, partial power up or a warm restart.

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: C01711

**Notice:** For bit 00:  
If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

**Note:** SDI: Safe Direction (safe motion direction)  
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)  
For bit 00:  
For bit = 1 and with the SSM safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.  
For bit = 0 and with the SSM safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.  
For bit 08:  
For bit = 1 and with the SDI safety function activated, the following applies:  
- During pulse suppression, monitoring is switched off and the status signal indicates inactive.  
For bit = 0 and with the SDI safety function activated, the following applies:  
- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

<b>Description:</b>	Setting for isochronous communication between PROFIdrive controller and Control Unit. The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1). If a PROFIdrive controller exchanges process data isochronously with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data isochronously. Examples for isochronous communication: - isochronous control for the motion control (e.g. SIMOTION). - isochronous PROFIsafe master (e.g. SIMATIC S7-400F).

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00000 [ms]	25.00000 [ms]	0.00000 [ms]
<b>Description:</b>	Sets the clock cycle time of the actual value sensing for safe motion monitoring. Setting criteria if the motion monitoring functions are executed with an encoder. - a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing. - the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.		

- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Setting criteria if the motion monitoring functions are executed without an encoder:

- the actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115[0]).

For SINAMICS S120M, the following applies:

Only setting p9511 = 0 or 2 ms is possible (a value of 0 is internally assumed to be 2).

**Dependency:**

Refer to: p0115

Refer to: F01652

**Note:**

The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1).

The monitoring clock cycle from p9500 must be an integer multiple of this parameter.

In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.

The clock cycle time of the actual value sensing should not be set to more than 8 ms.

A change only becomes effective after a POWER ON.

**Description:** Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

### 2.2 List of parameters

**Note:** The parameter is only effective when PROFIsafe telegram 901 is selected.  
By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.  
If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C0711 with value 7001 is output and safety stop response STOP F.

<b>p9585</b>		<b>SI Motion actual value sensing sensorless fault tolerance (CU) / ActVal sl tol CU</b>		
VECTOR_G	<b>Can be changed:</b> C2(95)	<b>Calculated:</b> -	<b>Access level:</b> 3	
	<b>Data type:</b> Integer32	<b>Dyn. index:</b> -	<b>Func. diagram:</b> -	
	<b>P-Group:</b> Safety Integrated	<b>Unit group:</b> -	<b>Unit selection:</b> -	
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	-1	4	-1	
<b>Description:</b>	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.			
<b>Dependency:</b>	Refer to: r9787 Refer to: F01681, C01711			
<b>Notice:</b>	Reducing this value can have a negative impact on the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).			
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).			

<b>p9586</b>		<b>SI Motion actual value sensing sensorless delay time (CU) / ActVal sl t_del CU</b>

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	5.00 [ms]	1000.00 [ms]	100.00 [ms]	
<b>Description:</b>	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).			
<b>Dependency:</b>	Refer to: C01711			
<b>Caution:</b>	The safety functionality is only completely guaranteed after this time has expired.			
				
<b>Notice:</b>	If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.			
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock cycle.			

<b>p9587</b>		<b>SI Motion actual value sensing sensorless filter time (CU) / Actv sl t_filt CU</b>

	<b>Data type:</b> FloatingPoint32	<b>Dyn. index:</b> -	<b>Func. diagram:</b> -	
	<b>P-Group:</b> Safety Integrated	<b>Unit group:</b> -	<b>Unit selection:</b> -	
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	0.00 [ms]	100.00 [ms]	25.00 [ms]	
<b>Description:</b>	Sets the filter time for smoothing the actual value with sensorless actual value sensing.			
<b>Notice:</b>	A longer filter time results in a longer response time.			
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order lowpass filter For p9587 = minimum value, the filter is deactivated. The set time is rounded internally to an integer multiple of the monitoring clock cycle.			

<b>p9588</b>		<b>SI Motion actual value sensing sensorless minimum current (CU) / ActVal sl I_min CU</b>

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	0.00 [%]	1000.00 [%]	10.00 [%]	
<b>Description:</b>	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).			
	- the value must be increased if C01711 has occurred with message value 1042.			
	- the value must be decreased if C01711 has occurred with message value 1041.			
	For synchronous motors, the following condition must be fulfilled:  p0305 x p9783  >= p9588 x 1.2			
<b>Recommendation:</b>	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.			
<b>Dependency:</b>	Refer to: r9785 Refer to: C01711			
<b>Notice:</b>	If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.			
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).			
<b>p9589</b>		<b>SI Motion act. value sensing sensorless acceleration limit (CU) / ActVal sl a_lim CU</b>		
VECTOR_G	<b>Can be changed:</b> C2(95)	<b>Calculated:</b> -	<b>Access level:</b> 3	
	<b>Data type:</b> FloatingPoint32	<b>Dyn. index:</b> -	<b>Func. diagram:</b> -	
	<b>P-Group:</b> Safety Integrated	<b>Unit group:</b> -	<b>Unit selection:</b> -	
	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1	
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>	
	10.00 [%]	3300.00 [%]	100.00 [%]	
<b>Description:</b>	Sets the acceleration limit to filter velocity fluctuations.			
	If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.			
	If this value is decreased, and this dampens the velocity peaks when accelerating.			
	- the value must be increased if C01711 with message value 1043 has occurred.			
	- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.			
<b>Recommendation:</b>	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.			
	To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.			
<b>Dependency:</b>	Refer to: r9784 Refer to: C01711			
<b>Note:</b>	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).			
	For p9589 = maximum value, the filter is deactivated.			
	Diagnostics parameter p9784 must be used to correctly set this parameter.

<b>Description:</b>	Sets the enable signal for the function "Safe Brake Control" (SBC) on the Control Unit.			
<b>Value:</b>	0: Inhibit SBC 1: Enable SBC			
<b>Dependency:</b>	Refer to: p9802			
<b>Note:</b>	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible. ## 2 Parameters

### 2.2 List of parameters

**Note:** The following signal sources are permitted:

- fixed zero (standard setting).
- digital inputs DI 0 ... 7, 16, 17, 20, 21 on the Control Unit 320-2 (CU320-2).
- digital inputs DI 0 ... 3, 16, 17 on the Controller Extensions (CX32-2, NX10.3, NX15.3).
- digital inputs DI 0 ... 3, 16 on the Control Unit 310-2 (CU310-2).

It is not permitted to establish an interconnection to a digital input in the simulation mode.

For a parallel circuit configuration of n power units, the following applies:

p9620[0] = Signal source for power unit 1  
...  
p9620[n-1] = Signal source for power unit n

<b>Description:</b>	Sets the signal source for Safe Brake Adapter (SBA). This defines via which digital input the Safe Brake Adapter feedback signal is read-in (SBA_DIAG). p9621/p9821 = 0: There is no Safe Brake Control (SBC) with Safe Brake Adapter (SBA) available. p9621/p9821 = r0722.x (x = 0, 1 ... 7) Safe Brake Adapter and Booksize unit (no Communication Interface Module (CIM)). p9621/p9821 = r9872.3 Safe Brake Adapter and Chassis unit (CIM).		
<b>Dependency:</b>	Refer to: p9601, p9602, p9821		
<b>Note:</b>	No difference is tolerated for a data cross-check between p9621 and p9821. To use the "Safe Brake Adapter" function the following must apply: p9601 = p9801 <> 0 and p9602 = p9802 = 1

<b>Description:</b>	Sets the delay times for activating and deactivating the Safe Brake Adapter relay. The relay-specific minimum delay times for evaluating the feedback signal contacts have to be set. They differ for the activation and deactivation of one and the same relay.		
<b>Index:</b>	[0] = Wait time activation [1] = Wait time deactivation		
<b>Dependency:</b>	Refer to: p9822		
<b>Note:</b>	For a data cross-check between p9622 and p9822, a difference of one Safety monitoring clock cycle is tolerated. 	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [ms]	2000.00 [ms]	500.00 [ms]
<b>Description:</b>	Sets the discrepancy time to change over the safety-related inputs (SGE) on the Control Unit. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this discrepancy time.		
<b>Dependency:</b>	Refer to: p9850		
<b>Note:</b>	For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SGE: Safety-related input (e.g. STO terminals)

	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	0.00 [ms]	100.00 [ms]	0.00 [ms]
<b>Description:</b>	Sets the debounce time for the failsafe digital inputs used to control STO/SBC/SS1.		
<b>Notice:</b>	To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]: - if p0799[0] is less than 1 ms, then p9651 = 1 ms or a multiple integer of 1 ms. - if p0799[0] is greater or equal to 1 ms, then p9651 must = p0799[0] - or must be a multiple integer of p0799[0].		
<b>Note:</b>	The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed. The set debounce time impacts the response time of the safety function.

<b>Description:</b>	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).		
<b>Recommendation:</b>	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time $\geq$ p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time $\geq$ p1135 + p1228		
<b>Dependency:</b>	Refer to: p1135, p9852		
<b>Note:</b>	Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9612 = 1). For a data cross-check between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

<b>Description:</b>	Sets the drive-based braking response for the "Safe Stop 1" (SS1) function.		
<b>Value:</b>	0: SS1 with OFF3 1: SS1E external stop		
<b>Note:</b>	SS1: Safe Stop 1 (Safe Stop 1, corresponds to Stop Category 1 acc. to EN60204) SS1E: Safe Stop 1 external (Safe Stop 1 with external stop) SS1E requires the externally initiated stop in order to be in conformance with stop Category 1. With this parameter, a switchover is made from SS1 to SS1E, and the drive-based braking response of function SS1 (time controlled) of the Basic Functions is deactivated.

<b>Note:</b>	For a data cross-check between p9658 and p9858, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. If a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119). As a consequence, the drive can still be braked in a controlled fashion during this delay time. **Description:** Setting to acknowledge that a component has been replaced.  
 By writing 29 to this parameter, the unique identifier of a safety-relevant component is transferred into the drive parameterization.

**Value:** 0: [00 hex] hardware replacement acknowledge ready  
 29: [1D hex] hardware replacement acknowledgment

**Dependency:** Refer to: F01640

**Notice:** It is not permissible that the safety commissioning mode is set in order to write to this parameter.

**Note:** After successful execution, this parameter is automatically reset to zero.  
 Data must then be saved in a non-volatile fashion (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").  
 The parameter cannot be written to using a project download, and cannot be set in an offline project.

**Description:**

Sets the signal source for the test stop of the safety-relevant motion monitoring functions.

**Notice:**

Before setting the signal source in p9705 it must be ensured that the signal source is at a logical 0.

If, in the Safety commissioning mode, the signal source in p9705 is set - and it already has a logical 1 - then a test stop is immediately initiated and the messages C01711/C30711 are output with message value 1005.

**Note:**

It is not permissible to use TM54F inputs to start the test stop.

Index1: of the encoder actual value GX\_Xist1 in the clock cycle, from which the subsequently transferred reference position was received.

Index2: the difference between index1 and index0 while waiting for the reference position to be transferred.

Index1 and index2 are only relevant for safety monitoring functions requiring an encoder with absolute reference when the "Referencing via SCC" function is enabled (p9501 Bit27 = 1)

**Index:**

- [0] = Encoder actual value Xist1 on CU
- [1] = Encoder actual value Xist1 latched for referencing
- [2] = Xist1 latched - reference position difference

**Note:**

The parameter is only available for Safety Integrated with encoder

This bit can be used, to execute a drive-based or control-based ESR.

For bit 04:

When sensing the velocity without encoder, a distinction is made between the closed-loop speed controlled and open-loop speed controlled (U/f) modes.

For bit 09:

Safe pulse cancellation is a state that can only occur for the combination of velocity sensing without encoder (p9506) and drive-integrated motion monitoring functions without selection (p9601.5). In this state, internally an STO is initiated, which can be withdrawn again using an OFF1 enable.

For bit 12:

An active test stop is also displayed using the safety message C01798.

ESR: Extended Stop and Retract

**Description:** Displays the safe maximum velocity (on the load side) that is permissible for the safe motion monitoring functions as a result of the actual value sensing.

This parameter indicates up to which load velocity the safe encoder actual values (redundant encoder coarse position) can still be correctly detected as a result of the particular encoder parameterization.

This parameter is only of significance for enabled safety with encoder (otherwise "0").

**Note:** If the value displayed is exceeded, message C01711 is output indicating relevant subsequent faults.

	<b>Not for motor type:</b> -	<b>Scaling:</b> -	<b>Expert list:</b> 1
	<b>Min</b>	<b>Max</b>	<b>Factory setting</b>
	- [rpm]	- [rpm]	- [rpm]
<b>Description:</b>	<p>Displays the velocity resolution for safety-relevant motion monitoring functions.</p> <p>For index [0]:</p> <p>Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect.</p>		

<b>Index:</b>	For index [1]: Displays the safe velocity accuracy based on the safe encoder accuracy [0] = Actual velocity resolution [1] = Minimum velocity resolution
<b>Note:</b>	For index [0]: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle). Example: For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained. For index [1]: - for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary). - for safety without encoder, index 1 is not relevant, and is always the value of zero.

<b>Description:</b>	Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value.		
<b>Recommendation:</b>	For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized. - CI: p1051 = r9733[0] - CI: p1052 = r9733[1] Additional limiting can also be activated using connector input p1085 and p1088.		
<b>Index:</b>	[0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute		
<b>Dependency:</b>	For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side) For SDI negative: r9733[0] = 0 For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side) For SDI positive: r9733[1] = 0 [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: p9522 / (p9521 x p9520) - otherwise: p9522 / p9521 Refer to: p9531, p9533		
<b>Notice:</b>	If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa. If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.		
<b>Note:</b>	The unit changeover between linear and rotary axis is not implemented via the safety changeover (p9502) but by the linear motor changeover. If the "SLS" or "SDI" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082. The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722. When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

**Note:**

CU: Control Unit

ESR: Extended Stop and Retract

SBC: Safe Brake Control

SBR: Safe Brake Ramp (safe brake ramp monitoring)

SCA: Safe Cam

SCC: Safety Control Channel

SDI: Safe Direction (safe motion direction)

SI: Safety Integrated

SLA: Safely-Limited Acceleration

SLP: Safely-Limited Position

SLS: Safely-Limited Speed / SG: Safely reduced speed

SOS: Safe Operating Stop / SBH: Safe operating stop

SP: Safe Position

SS1: Safe Stop 1

SS1E: Safe Stop 1 External (Safe Stop 1 with external stop)

SS2E: Safe Stop 2 external (Safe Stop 2 with external stop, external STOP D)

SSM: Safe Speed Monitor (safety-related feedback signal from the speed monitoring) / SGA n < nx: Safety-related output n < nx

STO: Safe Torque Off / SH: Safe standstill

For bit 16:

SS1E is supported for Safety Extended Functions.

<b>Note:</b>	For bit 00: When STO or "Safe pulse cancellation" is selected, the cause is displayed in bits 16 ... 21.				
	For bit 01: - For p9772.1 = 1 and p9772.19 = 0, an STO from the Safety Basic functions is active. - For p9772.1 = 1 and p9772.19 = 1, safe pulse cancellation is active, if safety functions without selection are activated via p9601.2/p9801.2 = 1 and p9601.5/p9801.5 = 1.				
	Note: If p9601.0 = 1 and p9601.2 = 1 and p9801.5 = 1 then for bit 0 and 1, the STO function applies.				
	For bit 05: When SS1 is selected, the cause is displayed in bits 22 and 23.				
	For bit 18: When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).				
	For bit 19: With SMM encoderless no actual value sensing is possible on account of OFF2. With SMM with encoder no actual value sensing is possible on account of parking. For Safety functions without selection, safe pulse cancellation to selected (p9772.19 = 1).				
	SMM: Safe Motion Monitoring				
	For bit 22 and 23: These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time. If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

**Description:** Sets the additional field-generating current for synchronous motors with sensorless actual value sensing. The set value is referred to p0305. This parameter ensures a "base load" for the motor. The value must fulfill the following condition:  
 $|p0305 \times p9783| \geq p9588 \times 1.2$

**Dependency:** Refer to: p9588  
Refer to: C01711

**Notice:** Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.

**Note:** This parameter is only effective for encoderless actual value sensing ( $p9506/p9306 = 1, 3$ ).  
For p9783 = maximum value, current injection is deactivated.  
Current injection is not effective in the U/f control mode.

<b>Description:</b>	Displays the acceleration resolution (load side) for the "SLA" function. Setpoints for acceleration limits or parameter changes for acceleration levels below this threshold have no effect.		
<b>Note:</b>	This parameter does not provide any information about the actual accuracy of the acceleration sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi <sup>2</sup> ) to m/s <sup>2</sup> (linear) or 1/s <sup>2</sup> (rotary) with Tsi = p9500 (SI motion monitoring clock cycle) Example: For Tsi = 12 ms, r9790 = 0.006944 m/s <sup>2</sup> (linear) or 0.019290 1/s <sup>2</sup> (rotary) is obtained. Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result is 0.006944 m/s <sup>2</sup> (linear) or 0.019290 1/s <sup>2</sup> (rotary). The result listed above is applicable for the default setting of spindle pitch and gear unit stage. **Description:** Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module.

0: Inhibit SBC

1: Enable SBC

**Dependency:** Refer to: p9602

**Notice:** This parameter is overwritten by the copy function of the safety functions integrated in the drive.

**Note:** The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

<b>Recommendation:</b>	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time $\geq$ p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time $\geq$ p1135 + p1228

When SS1 is selected, the cause is displayed in bits 22 and 23.

For bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

SMM: Safe Motion Monitoring

For bit 22, 23:

These bits show via which path the SS1 was triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

For bit 24:

Only for a parallel connection and active motion monitoring functions.

The following parameter values are available:

p9904 = 1 --> the procedure is started.

p9904 = 0 after starting --> the procedure has been successfully completed.

p9904 = 1 after starting --> the procedure has not been successfully completed.

The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2.

Byte 2:

Number of structural differences.

Byte 3:

Number of differences that can be acknowledged (p9904).

Byte 4:

Number of differences. These differences can be resolved as follows:

- sets the topology comparison (p9906 or p9907/p9908).

- change over the actual topology.

The appropriate action should be selected corresponding to the message that is displayed/output.

**Note:** In order to permanently accept the acknowledgment of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).

## 2 Parameters

### 2.2 List of parameters

**Note:** The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9906 = 0: Component type, Article Number, Hardware version, Manufacturer, Serial No.

p9906 = 1: Component type, Article Number

p9906 = 2: Component type

p9906 = 3: Component class (e.g. Sensor Module or Motor Module)

**Description:** Sets the type of comparison of a component in the target topology with the actual topology.  
The comparison is started by setting the required value.

**Value:**

- 0: High: Compares the complete electronic rating plate
- 1: Medium: Compares the component type and the article number
- 2: Low: Compares the component type
- 3: Minimum: Compares the component class
- 99: Topology has different comparison stages

**Dependency:** Refer to: p9907

**Note:** The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Article No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Article Number

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

<b>Description:</b>	For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion. For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned: - component type (e.g. "SMC20") - article number (e.g. "6SL3055-0AA0-5BA0") For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.		
<b>Dependency:</b>	Refer to: p9904, p9905		
<b>Note:</b>	The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON). Special case for Control Unit and option slot modules: When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

<b>Description:</b>	Enters the license key for this drive unit. Example of the license key: EACZ-QBCA = 69 65 67 90 45 81 66 67 65 dec (ASCII characters) Index 0 = license key character 1 (e.g. 69 dec) Index 1 = license key character 2 (e.g. 65 dec) ... Index 8 = license key character 9 (e.g. 65 dec) Index 9 = license key character 10 (e.g. 0 dec) ...		
<b>Dependency:</b>	Refer to: r7843, p9921 Refer to: F13000, A13001, F13010		
<b>Notice:</b>	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. With the STARTER commissioning tool, the ASCII characters are not entered coded, i.e. the license key characters can be entered as printed in the Certificate of License. In this case, the commissioning tool codes the characters.		
<b>Note:</b>	For an invalid license key, all the indices have the value 0 dec. Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-"). When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec. After entering the license key, the license key must be activated (p9921). The following fault and LED indicate that the licensing is not adequate: - F13000 --> licensing not adequate - LED READY --> flashes red at approximately 2 Hz

## 2 Parameters

### 2.2 List of parameters

**Dependency:** Refer to: p9920  
Refer to: F13000, A13001, F13010

**Note:** Before activation, the license key entered using parameter p9920 is checked. If this check identifies an error, activation is rejected. In this case, writing a 1 to p9921 is rejected.  
When the license key has been activated, p9921 is automatically set to 0.

<b>Description:</b>	Select a failsafe digital input (F-DI) for the signal "acknowledge internal event" (internal fault). The signal is transferred to the corresponding control signal of all drives. The falling edge at this input resets the status "internal event" in the drives. The rising edge at this input acknowledges any existing discrepancy errors.

**Description:**

Sets the signal source to initiate the test stop.  
For example, a digital input of the Control Unit or one of the other Terminal Modules can be set as signal source.  
The test stop is triggered on a 0/1 signal edge.  
The TM54F must be in the "ready" state (p0010 = 0).

**Description:**

Selects a failsafe digital input (F-DI) for the "SLP retract" function.  
A rising edge at this F-DI makes it possible to retract the drives, which at this instant in time indicate a violation of the SLP limit.  
After safe acknowledgment of the active safety faults, the drives can be traversed in the direction of the permitted position range.  
In the retract mode, SLP becomes inactive, and SDI, if enabled, is selected in the direction of the permitted position range.  
A 0 signal at the F-DI for retraction, deactivates the active retraction mode (SLP becomes active again, and SDI selected corresponding to the actual F-DIs).

**Value:**

0: Function inactive

2: F-DI 1 (X521.4/5/7)

 9: F-DI 8 (X532.3/4/8)  
 10: F-DI 9 (X532.5/6/9)

**Note:** - retraction is only possible if SDI is not already selected in the opposite direction of the permitted position range.  
 - a discrepancy at this F-DI must be acknowledged using a safe acknowledgment.

	09	F-DI 9	Logical 1	Logical 0	2894

**Dependency:** Refer to: p10017, p10040

**Note:** If a safety function is assigned to an input (e.g. via p10022), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10040) of the input as NC contact or NO contact, and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

### 2.3.3

### Parameters for encoder data sets (EDS)

The following list contains the parameters that are dependent on the encoder data sets.

Product: SINAMICS G130/G150, Version: 5103400, Language: eng, Type: EDS

p0141[0...n]	Encoder interface (Sensor Module) component number / Enc_interf comp_no
p0142[0...n]	Encoder component number / Encoder comp_no
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0145[0...n]	Activate/deactivate encoder interface / Enc_intf act/deact
r0146[0...n]	Encoder interface active/inactive / Enc_intf act/inact
r0147[0...n]	Sensor Module EEPROM data version / SM EEPROM version
r0148[0...n]	Sensor Module firmware version / SM FW version
p0400[0...n]	Encoder type selection / Enc_typ sel
p0402[0...n]	Gearbox type selection / Gearbox type sel
p0404[0...n]	Encoder configuration effective / Enc_config eff
p0405[0...n]	Square-wave encoder track A/B / Sq-wave enc A/B
p0407[0...n]	Linear encoder grid division / Enc grid div
p0408[0...n]	Rotary encoder pulse number / Rot enc pulse No.
p0410[0...n]	Encoder inversion actual value / Enc inv act value
p0411[0...n]	Measuring gear configuration / Meas gear config
p0412[0...n]	Measuring gear absolute encoder rotary revolutions virtual / Abs rot rev
p0413[0...n]	Measuring gear position tracking tolerance window / Pos track window
p0414[0...n]	Redundant coarse position value relevant bits (identified) / Relevant bits
p0415[0...n]	Gx_XIST1 Coarse position safe most significant bit (identified) / Gx_XIST1 safe MSB
p0416[0...n]	Non safety-relevant meas. steps position value POS1 (detected) / nsrPos1
p0417[0...n]	Encoder safety comparison algorithm (detected) / Safety comp_algo
p0418[0...n]	Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1
p0419[0...n]	Fine resolution absolute value Gx_XIST2 (in bits) / Enc fine Gx_XIST2
p0420[0...n]	Encoder connection / Enc_connection
p0421[0...n]	Absolute encoder rotary multiturn resolution / Enc abs multiturn
p0422[0...n]	Absolute encoder linear measuring step resolution / Enc abs meas step
p0423[0...n]	Absolute encoder rotary singleturn resolution / Enc abs singleturn
p0424[0...n]	Encoder linear zero mark distance / Enc lin ZM_dist
p0425[0...n]	Encoder rotary zero mark distance / Enc rot dist ZM
p0426[0...n]	Encoder zero mark differential distance / Enc ZM Dif_dist

p0427[0...n]	Encoder SSI baud rate / Enc SSI baud rate
p0428[0...n]	Encoder SSI monoflop time / Enc SSI t_monoflop
p0429[0...n]	Encoder SSI configuration / Enc SSI config
p0430[0...n]	Sensor Module configuration / SM config
p0431[0...n]	Angular commutation offset / Ang_com offset
p0432[0...n]	Gearbox factor encoder revolutions / Grbx_fact enc_rev
p0433[0...n]	Gearbox factor motor/load revolutions / Grbx_fact mot_rev
p0434[0...n]	Encoder SSI error bit / Enc SSI error bit
p0435[0...n]	Encoder SSI alarm bit / Enc SSI alarm bit
p0436[0...n]	Encoder SSI parity bit / Enc SSI parity bit
p0437[0...n]	Sensor Module configuration extended / SM config ext
p0438[0...n]	Squarewave encoder filter time / Enc t_filt
p0439[0...n]	Encoder ramp-up time / Enc ramp-up time
p0440[0...n]	Copy encoder serial number / Copy enc ser_no
p0441[0...n]	Encoder commissioning serial number part 1 / Enc comm ser_no 1
p0442[0...n]	Encoder commissioning serial number part 2 / Enc comm ser_no 2
p0443[0...n]	Encoder commissioning serial number part 3 / Enc comm ser_no 3
p0444[0...n]	Encoder commissioning serial number part 4 / Enc comm ser_no 4
p0445[0...n]	Encoder commissioning serial number part 5 / Enc comm ser_no 5
p0446[0...n]	Encoder SSI number of bits before the absolute value / Enc SSI bit before
p0447[0...n]	Encoder SSI number of bits absolute value / Enc SSI bit val
p0448[0...n]	Encoder SSI number of bits after the absolute value / Enc SSI bit after
p0449[0...n]	Encoder SSI number of bits filler bits / Enc SSI fill bits
p0453[0...n]	Pulse encoder evaluation zero speed measuring time / Enc_ev n_0 t_meas
p0454[0...n]	Sensor Module configuration extended Part 2 / SM config ext 2
p0493[0...n]	Zero mark selection input terminal / ZM_sel inp_term
p0494[0...n]	Equivalent zero mark input terminal / ZM_equiv inp_term
p4600[0...n]	Motor temperature sensor 1 sensor type / Temp_sens 1 type
p4601[0...n]	Motor temperature sensor 2 sensor type / Temp_sens 2 type
p4602[0...n]	Motor temperature sensor 3 sensor type / Temp_sens 3 type
p4603[0...n]	Motor temperature sensor 4 sensor type / Temp_sens 4 type
p4630[0...n]	Absolute encoder linear measuring step factor / Abs_enc meas fact
p4649[0...n]	Encoder function reserve amplitude limit incremental signals / Enc fct amp inc
p4662[0...n]	Encoder characteristic type / Enc char_type
p4663[0...n]	Encoder characteristic K0 / Enc char K0
p4664[0...n]	Encoder characteristic K1 / Enc char K1
p4665[0...n]	Encoder characteristic K2 / Enc char K2
p4666[0...n]	Encoder characteristic K3 / Enc char K3
p4670[0...n]	Analog sensor configuration / Ana_sens config
p4671[0...n]	Analog sensor input / Ana_sens inp
p4672[0...n]	Analog sensor channel A voltage at actual value zero / Ana_sens A U at 0
p4673[0...n]	Analog sensor channel A voltage per encoder period / Ana_sens A U/per
p4674[0...n]	Analog sensor channel B voltage at actual value zero / Ana_sens B U at 0
p4675[0...n]	Analog sensor channel B voltage per encoder period / Ana_sens B U/per
p4676[0...n]	Analog sensor range limit threshold / Ana_sens lim thr
p4677[0...n]	Analog sensor LVDT configuration / Ana_sens LVDT conf
p4678[0...n]	Analog sensor LVDT ratio / An_sens LVDT ratio
p4679[0...n]	Analog sensor LVDT phase / An_sens LVDT ph
p4680[0...n]	Zero mark monitoring tolerance permissible / ZM_monit tol perm
p4681[0...n]	Zero mark monitoring tolerance window limit 1 positive / ZM tol lim 1 pos
p4682[0...n]	Zero mark monitoring tolerance window limit 1 negative / ZM tol lim 1 neg
p4683[0...n]	Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos
p4684[0...n]	Zero mark monitoring tolerance window alarm threshold negative / ZM tol A_thr neg
p4685[0...n]	Speed actual value mean value generation / n_act mean val
p4686[0...n]	Zero mark minimum length / ZM min length

### 2.3.4 Parameters for motor data sets (MDS)

The following list contains the parameters that are dependent on the motor data sets.

Product: SINAMICS G130/G150, Version: 5103400, Language: eng, Type: MDS

p0131[0...n]	Motor component number / Mot comp_no
p0133[0...n]	Motor configuration / Motor config
p0300[0...n]	Motor type selection / Mot type sel
p0301[0...n]	Motor code number selection / Mot code No. sel
r0302[0...n]	Motor code number of motor with DRIVE-CLiQ / Mot code mot w/ DQ
r0303[0...n]	Motor with DRIVE-CLiQ status word / Motor w DQ ZSW
p0304[0...n]	Rated motor voltage / Mot U <sub>rated</sub>
p0305[0...n]	Rated motor current / Mot I <sub>rated</sub>
p0306[0...n]	Number of motors connected in parallel / Motor qty
p0307[0...n]	Rated motor power / Mot P <sub>rated</sub>
p0308[0...n]	Rated motor power factor / Mot cos phi rated
p0309[0...n]	Rated motor efficiency / Mot eta <sub>rated</sub>
p0310[0...n]	Rated motor frequency / Mot f <sub>rated</sub>
p0311[0...n]	Rated motor speed / Mot n <sub>rated</sub>
r0313[0...n]	Motor pole pair number, actual (or calculated) / Mot PolePairNo act
p0314[0...n]	Motor pole pair number / Mot pole pair No.
p0316[0...n]	Motor torque constant / Mot kT
p0318[0...n]	Motor stall current / Mot I <sub>standstill</sub>
p0320[0...n]	Motor rated magnetizing current/short-circuit current / Mot I <sub>mag<sub>rated</sub></sub>
p0322[0...n]	Maximum motor speed / Mot n <sub>max</sub>
p0323[0...n]	Maximum motor current / Mot I <sub>max</sub>
p0324[0...n]	Winding maximum speed / Winding n <sub>max</sub>
p0325[0...n]	Motor pole position identification current 1st phase / Mot PolID I 1st Ph
p0327[0...n]	Optimum motor load angle / Mot phi <sub>load opt</sub>
p0328[0...n]	Motor reluctance torque constant / Mot kT <sub>reluctance</sub>
p0329[0...n]	Motor pole position identification current / Mot PolID current
r0330[0...n]	Rated motor slip / Mot slip <sub>rated</sub>
r0331[0...n]	Actual motor magnetizing current/short-circuit current / Mot I <sub>mag<sub>rtd act</sub></sub>
r0332[0...n]	Rated motor power factor / Mot cos phi rated
r0333[0...n]	Rated motor torque / Mot M <sub>rated</sub>
r0334[0...n]	Actual motor-torque constant / Mot kT act
p0335[0...n]	Motor cooling type / Mot cool type
r0336[0...n]	Actual rated motor frequency / Mot f <sub>rated act</sub>
r0337[0...n]	Rated motor EMF / Mot EMF <sub>rated</sub>
r0339[0...n]	Rated motor voltage / Mot U <sub>rated</sub>
p0341[0...n]	Motor moment of inertia / Mot M <sub>inert</sub>
p0342[0...n]	Ratio between the total and motor moment of inertia / Mot MomInert Ratio
p0343[0...n]	Rated motor current identified / Mot I <sub>rated ident</sub>
p0344[0...n]	Motor weight (for the thermal motor model) / Mot weight th mod
r0345[0...n]	Nominal motor starting time / Mot t <sub>start<sub>rated</sub></sub>
p0346[0...n]	Motor excitation build-up time / Mot t <sub>excitation</sub>
p0347[0...n]	Motor de-excitation time / Mot t <sub>de-excitat</sub>
p0350[0...n]	Motor stator resistance cold / Mot R <sub>stator cold</sub>
p0352[0...n]	Cable resistance / R <sub>cable</sub>
p0353[0...n]	Motor series inductance / Mot L <sub>series</sub>
p0354[0...n]	Motor rotor resistance cold / damping resistance d axis / Mot R <sub>r cold/R<sub>D d</sub></sub>
p0355[0...n]	Motor damping resistance q axis / Mot R <sub>damp q</sub>
p0356[0...n]	Motor stator leakage inductance / Mot L <sub>stator leak</sub> .
p0357[0...n]	Motor stator inductance d axis / Mot L <sub>stator d</sub>
p0358[0...n]	Motor rotor leakage inductance / damping inductance d axis / Mot L <sub>r leak / LDd</sub>
p0359[0...n]	Motor damping inductance q axis / Mot L <sub>damp q</sub>

r0370[0...n]	Motor stator resistance cold / Mot R_stator cold
r0372[0...n]	Total power unit cable resistance / PU cable R tot
r0373[0...n]	Motor rated stator resistance / Mot R_stator rated
r0374[0...n]	Motor rotor resistance cold / damping resistance d axis / Mot R_r cold/R_D d
r0375[0...n]	Motor damping resistance q axis / Mot R_damp q
r0376[0...n]	Rated motor rotor resistance / Mot rated R_rotor
r0377[0...n]	Motor leakage inductance total / Mot L_leak total
r0378[0...n]	Motor stator inductance d axis / Mot L_stator d
r0380[0...n]	Motor damping inductance d axis / Mot L_damp d
r0381[0...n]	Motor damping inductance q axis / Mot L_damp q
r0382[0...n]	Motor magnetizing inductance transformed / Lh d axis saturated / Mot L_m tr/Lhd sat
r0383[0...n]	Motor magnetizing inductance q axis saturated / Mot L_magn q sat
r0384[0...n]	Motor rotor time constant / damping time constant d axis / Mot T_rotor/T_Dd
r0385[0...n]	Motor damping time constant q axis / Mot L_damping q
r0386[0...n]	Motor stator leakage time constant / Mot T_stator leak
r0387[0...n]	Motor stator leakage time constant q axis / Mot T_Sleak /T_Sq
p0389[0...n]	Excitation rated no-load current / Exc I_noload_rated
p0390[0...n]	Rated excitation current / Exc I_rated
p0391[0...n]	Current controller adaptation starting point Kp / I_adapt pt Kp
p0392[0...n]	Current controller adaptation starting point Kp adapted / I_adapt pt Kp adap
p0393[0...n]	Current controller adaptation P gain scaling / I_adapt Kp scal
r0395[0...n]	Actual stator resistance / R_stator act
r0396[0...n]	Actual rotor resistance / R_rotor act
p0397[0...n]	Angle magnetic decoupling maximum angle / Magn decpl max_ang
p0398[0...n]	Angle magn decoupling (cross saturation) coeff 1 / Magn decoupl C1
p0399[0...n]	Angle magn decoupling (cross saturation) coeff 3 / Magn decoupl C3
p0530[0...n]	Bearing version selection / Bearing vers sel
p0531[0...n]	Bearing code number selection / Bearing codeNo sel
p0532[0...n]	Bearing maximum speed / Bearing n_max
p0600[0...n]	Motor temperature sensor for monitoring / Mot temp_sensor
p0601[0...n]	Motor temperature sensor type / Mot_temp_sens type
p0604[0...n]	Mot_temp_mod 2: sensor alarm threshold / Mod 2: sens A_thr
p0605[0...n]	Mot_temp_mod 1/2 sensor threshold and temperature value / Mod 1/2 sens thr_T
p0606[0...n]	Mot_temp_mod 2: sensor timer / Mod 2:sens timer
p0607[0...n]	Temperature sensor fault timer / Sensor fault time
p0610[0...n]	Motor overtemperature response / Mot temp response
p0611[0...n]	I2t motor model thermal time constant / I2t mot_mod T
p0612[0...n]	Mot_temp_mod activation / Mot_temp_mod act
p0613[0...n]	Mot_temp_mod 1/3 ambient temperature / Mod 1/3 amb_temp
p0614[0...n]	Thermal resistance adaptation reduction factor / Therm R_adapt red
p0615[0...n]	Mot_temp_mod 1 (I2t) fault threshold / I2t F thresh
p0616[0...n]	Motor overtemperature alarm threshold 1 / Mot temp alarm 1
p0620[0...n]	Thermal adaptation, stator and rotor resistance / Mot therm_adapt R
p0621[0...n]	Identification stator resistance after restart / Rst_ident Restart
p0622[0...n]	Motor excitation time for Rs_ident after switching on again / t_excit Rs_id

p0624[0...n]	Motor temperature offset PT100 / Mot T_offset PT100
p0625[0...n]	Motor ambient temperature during commissioning / Mot T_ambient
p0626[0...n]	Motor overtemperature, stator core / Mot T_over core
p0627[0...n]	Motor overtemperature, stator winding / Mot T_over stator
p0628[0...n]	Motor overtemperature rotor / Mot T_over rotor
p0629[0...n]	Stator resistance reference / R_stator ref
r0630[0...n]	Mot_temp_mod ambient temperature / Mod T_ambient
r0631[0...n]	Mot_temp_mod stator iron temperature / Mod T_stator
r0632[0...n]	Mot_temp_mod stator winding temperature / Mod T_winding
r0633[0...n]	Mot_temp_mod rotor temperature / Mod rotor temp
p0634[0...n]	Q flux flux constant unsaturated / PSIQ KPSI UNSAT
p0635[0...n]	Q flux quadrature axis current constant unsaturated / PSIQ KIQ UNSAT
p0636[0...n]	Q flux direct axis current constant unsaturated / PSIQ KID UNSAT
p0637[0...n]	Q flux flux gradient saturated / PSIQ Grad SAT
p0643[0...n]	Overvoltage protection for synchronous motors / Overvolt_protect
p0650[0...n]	Actual motor operating hours / Mot t_oper act
p0651[0...n]	Motor operating hours maintenance interval / Mot t_op maint
p0652[0...n]	Motor stator resistance scaling / Mot R_stator scal
p0653[0...n]	Motor stator leakage inductance scaling / Mot L_S_leak scal
p0655[0...n]	Motor magnetizing inductance d axis saturated scaling / Mot L_m d sat scal

#### 2.3.5 Parameters for power unit data sets (PDS)

The following list contains the parameters that are dependent on the power unit data sets.

Product: SINAMICS G130/G150, Version: 5103400, Language: eng, Type: PDS

p0121[0...n]	Power unit component number / PU comp_no
p0124[0...n]	Power unit detection via LED / PU detection LED
p0125[0...n]	Activate/deactivate power unit components / PU_comp act/deact
r0126[0...n]	Power unit components active/inactive / PU comp act/inact
r0127[0...n]	Power unit EEPROM data version / PU EEPROM version
r0128[0...n]	Power unit firmware version / PU FW version
r0200[0...n]	Power unit code number actual / PU code no. act
p0201[0...n]	Power unit code number / PU code no
r0203[0...n]	Actual power unit type / PU actual type
r0204[0...n]	Power unit hardware properties / PU HW property
p0251[0...n]	Power unit heat sink fan operating hours counter / PU fan t_oper
p0254[0...n]	Operating hours counter power unit fan inside the converter / PU inner fan t_op
r0277[0...n]	Power unit heat sink fan wear counter / PU fan wear_count
p0895[0...n]	BI: Activate/deactivate power unit components / PU_comp act/deact
p3901[0...n]	Power unit EEPROM Vdc offset calibration / PU EEPROM Vdc offs
p7001[0...n]	Par_circuit power units enable / PU enable
r7002[0...n]	CO: Par_circuit status power units / Status PU
r7020[0...n]	CO: Par_circuit deviation current in phase U / Phase U curr dev
r7021[0...n]	CO: Par_circuit deviation current in phase V / Phase V curr dev
r7022[0...n]	CO: Par_circuit deviation current in phase W / Phase W curr dev
r7030[0...n]	CO: Par_circuit DC link voltage deviation / Vdc deviation
p7040[0...n]	Par_circuit correction valve lockout time phase U / Comp t_lockout U
p7042[0...n]	Par_circuit correction valve lockout time phase V / Comp t_lockout V
p7044[0...n]	Par_circuit correction valve lockout time phase W / Comp t_lockout W
r7050[0...n]	Par_circuit circulating current phase U / Circ_I_phase U
r7051[0...n]	Par_circuit circulating current phase V / Circ_I_phase V
r7052[0...n]	Par_circuit circulating current phase W / Circ_I_phase W
r7199[0...n]	Par_circuit power unit temperatures capacitor air discharge / PU temp capacitor
r7200[0...n]	Par_circuit power unit overload I2t / PU overload I2t
r7201[0...n]	CO: Par_circuit power unit temperatures max. inverter / PU temp max inv
r7202[0...n]	Par_circuit power unit temperatures max. depletion layer / PU TempMaxDepLayer
r7203[0...n]	CO: Par_circuit power unit temperatures max. rectifier / PU temp max rect
r7204[0...n]	CO: Par_circuit power unit temperatures air intake / PU temp air intake
r7205[0...n]	Par_circuit power unit temperatures electronics / PU temp electr
r7206[0...n]	Par_circuit power unit temperatures inverter 1 / PU temp inv 1
r7207[0...n]	Par_circuit power unit temperatures inverter 2 / PU temp inv 2
r7208[0...n]	Par_circuit power unit temperatures inverter 3 / PU temp inv 3
r7209[0...n]	Par_circuit power unit temperatures inverter 4 / PU temp inv 4
r7210[0...n]	Par_circuit power unit temperatures inverter 5 / PU temp inv 5
r7211[0...n]	Par_circuit power unit temperatures inverter 6 / PU temp inv 6
r7212[0...n]	Par_circuit power unit temperatures inverter 1 / PU temp rect 1
r7213[0...n]	Par_circuit power unit temperatures inverter 2 / PU temp rect 2
r7214[0...n]	Par_circuit power unit temperatures depletion layer 1 / PU temp DepLayer 1

r7215[0...n]	Par_circuit power unit temperatures depletion layer 2 / PU temp DepLayer 2
r7216[0...n]	Par_circuit power unit temperatures depletion layer 3 / PU temp DepLayer 3
r7217[0...n]	Par_circuit power unit temperatures depletion layer 4 / PU temp DepLayer 4
r7218[0...n]	Par_circuit power unit temperatures depletion layer 5 / PU temp DepLayer 5
r7219[0...n]	Par_circuit power unit temperatures depletion layer 6 / PU temp DepLayer 6
r7220[0...n]	CO: Par_circuit drive output current maximum / Drv I_outp max
r7222[0...n]	CO: Par_circuit absolute current actual value / I_act abs val
r7223[0...n]	CO: Par_circuit phase current actual value phase U / I_phase U act val
r7224[0...n]	CO: Par_circuit phase current actual value phase V / I_phase V act val
r7225[0...n]	CO: Par_circuit phase current actual value phase W / I_phase W act val
r7226[0...n]	CO: Par_circuit phase current actual value phase U offset / I_phase U offset
r7227[0...n]	CO: Par_circuit phase current actual value phase V offset / I_phase V offset
r7228[0...n]	CO: Par_circuit phase current actual value phase W offset / I_phase W offset
r7229[0...n]	CO: Par_circuit phase current actual value sum U, V, W / I_phase sum UVW
r7230[0...n]	CO: Par_circuit DC link voltage actual value / Vdc_act
r7231[0...n]	CO: Par_circuit phase voltage actual value phase U / U_phase U act val
r7232[0...n]	CO: Par_circuit phase voltage actual value phase V / U_phase V act val
r7233[0...n]	CO: Par_circuit phase voltage actual value phase W / U_phase W act val
r7240[0...n]	Par_circuit gating unit status word 1 / Gating unit ZSW1
p7786[0...n]	Service report / Service report
p9671[0...n]	SI module identifier Motor Module / Module ID MM

## 2.4 Parameters for write protection and know-how protection

### 2.4.1 Parameters with "WRITE\_NO\_LOCK"

The following list contains the parameters with the "WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS G130/G150, Version: 5103400, Language: eng, Type: WRITE\_NO\_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev comm par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0124[0...n]	Power unit detection via LED / PU detection LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0154	DRIVE-CLiQ Hub Module detection via LED / Hub detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p4700[0...1]	Trace control / Trace control
p4701	Measuring function control / Meas fct ctrl
p4703[0...1]	Trace options / Trace options
p4707	Measurement function configuration / Meas fct config
p4710[0...1]	Trace trigger condition / Trace Trig_cond
p4711[0...5]	Trace trigger signal / Trace trig_signal
p4712[0...1]	Trace trigger threshold / Trace trig_thresh
p4713[0...1]	Trace tolerance band trigger threshold 1 / Trace trig thr 1
p4714[0...1]	Trace tolerance band trigger threshold 2 / Trace trig thr 2
p4715[0...1]	Trace bit mask trigger, bit mask / Trace trig mask
p4716[0...1]	Trace bit mask trigger trigger condition / Trace Trig_cond
p4717	Measuring function number of averaging operations / Meas fct avg qty
p4718	Measuring function number of stabilizing periods / MeasFct StabPerQty
p4720[0...1]	Trace recording cycle / Trace record_cyc
p4721[0...1]	Trace recording time / Trace record_time
p4722[0...1]	Trace trigger delay / Trace trig_delay
p4723[0...1]	Trace time slice cycle / Trace cycle
p4724[0...1]	Trace average in the time range / Trace average
p4730[0...5]	Trace record signal 0 / Trace record sig 0
p4731[0...5]	Trace record signal 1 / Trace record sig 1
p4732[0...5]	Trace record signal 2 / Trace record sig 2
p4733[0...5]	Trace record signal 3 / Trace record sig 3
p4734[0...5]	Trace record signal 4 / Trace record sig 4
p4735[0...5]	Trace record signal 5 / Trace record sig 5
p4736[0...5]	Trace record signal 6 / Trace record sig 6
p4737[0...5]	Trace record signal 7 / Trace record sig 7

## 2.4 Parameters for write protection and know-how protection

p4780[0...1]	Trace physical address signal 0 / Trace PhyAddr Sig0
p4781[0...1]	Trace physical address signal 1 / Trace PhyAddr Sig1
p4782[0...1]	Trace physical address signal 2 / Trace PhyAddr Sig2
p4783[0...1]	Trace physical address signal 3 / Trace PhyAddr Sig3
p4784[0...1]	Trace physical address signal 4 / Trace PhyAddr Sig4
p4785[0...1]	Trace physical address signal 5 / Trace PhyAddr Sig5
p4786[0...1]	Trace physical address signal 6 / Trace PhyAddr Sig6
p4787[0...1]	Trace physical address signal 7 / Trace PhyAddr Sig7
p4789[0...1]	Trace physical address trigger signal / Trace PhyAddr Trig
p4795	Trace memory bank changeover / Trace mem changeov
p4800	Function generator control / FG control
p4810	Function generator mode / FG operating mode
p4812	Function generator physical address / FG phys address
p4813	Function generator physical address reference value / FG phys addr ref
p4815[0...2]	Function generator drive number / FG drive number
p4816	Function generator output signal integer number scaling / FG outp integ scal
p4819	BI: Function generator control / FG control
p4820	Function generator signal shape / FG signal shape
p4821	Function generator period / FG period duration
p4822	Function generator pulse width / FG pulse width
p4823	Function generator bandwidth / FG bandwidth
p4824	Function generator amplitude / FG amplitude
p4825	Function generator 2nd amplitude / FG 2nd amplitude
p4826	Function generator offset / FG offset
p4827	Function generator ramp-up time to offset / FG ramp-up offset
p4828	Function generator lower limit / FG lower limit
p4829	Function generator upper limit / FG upper limit
p4830	Function generator time slice cycle / FG time slice
p4831	Function generator amplitude scaling / FG amplitude scal
p4832[0...2]	Function generator amplitude scaling / FG amplitude scal
p4833[0...2]	Function generator offset scaling / FG offset scal
p4835[0...4]	Function generator free measurement function scaling / FG fr MeasFct scal
p4840[0...1]	MTrace cycle number setting / Cycle number
p7761	Write protection / Write protection
p7770	NVRAM action / NVRAM action
p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3
p9210	Flashing component number / Flash comp_no.
p9211	Flash function / Flash fct.
p9484	BICO interconnections search signal source / BICO S_src srch

### 2.4.2 Parameters with "KHP\_WRITE\_NO\_LOCK"

The following list contains the parameters with the "KHP\_WRITE\_NO\_LOCK" attribute.

These parameters are not affected by the know-how protection.

Product: SINAMICS G130/G150, Version: 5103400, Language: eng, Type: KHP\_WRITE\_NO\_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev comm par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0124[0...n]	Power unit detection via LED / PU detection LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0154	DRIVE-CLiQ Hub Module detection via LED / Hub detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2040	Fieldbus interface monitoring time / Fieldbus t_monit
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3105[0...3]	NTP server IP address / NTP IP addr
p3106	NTP time zone / Time zone
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p7761	Write protection / Write protection
p7770	NVRAM action / NVRAM action
p8550	AOP LOCAL/REMOTE / AOP LOCAL/REMOTE
p8806[0...53]	Identification and Maintenance 1 / I&M 1
p8807[0...15]	Identification and Maintenance 2 / I&M 2
p8808[0...53]	Identification and Maintenance 3 / I&M 3
p8835	CBE20 firmware selection / CBE20 FW sel
p8839[0...1]	PZD interface hardware assignment / PZD IF HW assign
p8840	COMM BOARD monitoring time / CB t_monit
p9210	Flashing component number / Flash comp_no.
p9211	Flash function / Flash fct.
p9484	BICO interconnections search signal source / BICO S_src srch

### 2.4.3 Parameters with "KHP\_ACTIVE\_READ"

The following list contains the parameters with the "KHP\_ACTIVE\_READ" attribute.

These parameters can also be read with activated know-how protection.

Product: SINAMICS G130/G150, Version: 5103400, Language: eng, Type: KHP\_ACTIVE\_READ

p0015	Macro drive unit / Macro drv unit
p0015	Macro drive object / Macro DO
p0100	IEC/NEMA Standards / IEC/NEMA Standards
p0101[0...n]	Drive object numbers / DO numbers
p0103[0...n]	Application-specific view / Appl_spec view
p0105	Activate/deactivate drive object / DO act/deact
p0107[0...n]	Drive object type / DO type
p0108[0...n]	Drive objects function module / DO fct_mod
p0120	Number of Power unit Data Sets (PDS) / PDS count
p0121[0...n]	Power unit component number / PU comp_no
p0125[0...n]	Activate/deactivate power unit components / PU_comp act/deact
p0130	Number of Motor Data Sets (MDS) / MDS count
p0131[0...n]	Motor component number / Mot comp_no
p0140	Number of Encoder Data Sets (EDS) / EDS count
p0141[0...n]	Encoder interface (Sensor Module) component number / Enc_intf comp_no
p0142[0...n]	Encoder component number / Encoder comp_no
p0145[0...n]	Activate/deactivate encoder interface / Enc_intf act/deact
p0150	Number of VSM data sets / VSM dat_sets qty.
p0151[0...n]	Voltage Sensing Module component number / VSM comp_no
p0151	Terminal Module component number / TM comp_no
p0151[0...1]	DRIVE-CLiQ Hub Module component number / Hub comp_no
p0161	Option board component number / Opt board comp_no
p0170	Number of Command Data Sets (CDS) / CDS count
p0171[0...n]	Drive objects function module 1 / DO fct_mod 1
p0172[0...n]	Drive objects function module 2 / DO fct_mod 2
p0173[0...n]	Drive objects function module 3 / DO fct_mod 3
p0180	Number of Drive Data Sets (DDS) / DDS count
p0199[0...24]	Drive object name / DO name
p0300[0...n]	Motor type selection / Mot type sel
p0304[0...n]	Rated motor voltage / Mot U_rated
p0305[0...n]	Rated motor current / Mot I_rated
p0349	System of units motor equivalent circuit diagram data / Unit_sys mot ESB
p0400[0...n]	Encoder type selection / Enc_typ sel
p0505	Selecting the system of units / Unit sys select
p0595	Technological unit selection / Tech unit select
p0806	BI: Inhibit master control / PcCtrl inhibit
p0864	BI: Infeed operation / INF operation
p0870	BI: Close main contactor / Close main cont
p0922	IF1 PROFIdrive PZD telegram selection / IF1 PZD telegr
p0978[0...n]	List of drive objects / List of the DO
p1080[0...n]	Minimum speed / n_min
p1082[0...n]	Maximum speed / n_max
p1520[0...n]	CO: Torque limit upper / M_max upper
p2000	Reference speed reference frequency / n_ref f_ref
p2000	Reference frequency / f_ref
p2000	Reference velocity reference frequency / v_ref f_ref
p2001	Reference voltage / Reference voltage
p2002	Reference current / I_ref
p2003	Reference torque / M_ref
p2005	Reference angle / Reference angle

## 2 Parameters

### 2.4 Parameters for write protection and know-how protection

p2006	Reference temperature / Ref temp
p2007	Reference acceleration / a_ref
p2030	Field bus interface protocol selection / Field bus protocol
p2038	IF1 PROFIdrive STW/ZSW interface mode / PD STW/ZSW IF mode
p2079	IF1 PROFIdrive PZD telegram selection extended / IF1 PZD telegr ext
p4956[0...n]	TEC DO-specific activation / TEC DO act
p7763	KHP OEM exception list number of indices for p7764 / KHP OEM qty p7764
p7764[0...n]	KHP OEM exception list / KHP OEM excep list
p7852	Number of indices for r7853 / Qty indices r7853
p8836	SINAMICS link node address / Node address
p8864	IF1 PROFIdrive first supplementary telegram selection / IF1 Pd 1. sup_tel
p8865	IF1 PROFIdrive second supplementary telegram selection / IF1 Pd 2. sup_tel
p8870[0...15]	SINAMICS Link PZD receive word / PZD rcv word
p8870[0...31]	SINAMICS Link PZD receive word / PZD rcv word
p8871[0...15]	SINAMICS Link PZD send word / PZD send word
p8871[0...31]	SINAMICS Link PZD send word / PZD send word
p8872[0...15]	SINAMICS Link PZD receive address / PZD rcv adr.
p8872[0...31]	SINAMICS Link PZD receive address / PZD rcv adr.
p9500	SI Motion monitoring clock cycle (Control Unit) / SI Mtn clock CU
p9601	SI enable functions integrated in the drive (Control Unit) / SI enable fct CU
p9810	SI PROFIsafe address (Motor Module) / SI Ps address MM
p9902	Target topology number of indices / TargetTopo indices

<b>Data sets</b>		<b>Information on parameters, binectors, connectors</b>					
Symbol	Meaning	Symbol	Meaning				
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).	Parameter name	Parameter name (up to 18 characters).				
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).	[Unit]	[dimension unit] rotatory axis, for linear axis see list of parameters.				
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).	rxxx[y] or rxxx[y...z] or rxxx[y].ww or rxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "y" specifies the valid index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).	pxxxx[y] or pxxxx[y...z] or pxxxx[y].ww or pxxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "y" specifies the applicable index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).	from ... to	Value range.				
		(xxxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.				
		(Def)	Factory setting.				
		(Def.w)	Factory setting with bit number as prefix.				
		[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]				
		<b>Samplings times</b>					
		pxxxx[Y] (ZZZ.ZZ μs)		Setting parameter with factory setting to select the time slice.			
		p0115[y] (Drive Object)		Time slice depending on the pre-setting p0112 of the drive object. "y" specifies the applicable index.			
		p0115[y] (Motor Modules)		Time slice depending on the rated pulse frequency of the motor module. "y" specifies the applicable index.			
		PROFIdrive sampling time		Presetting for IF1 in p2048. Presetting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.			
		CAN bus sampling time		Presetting in p8848.			
		Background		There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.			
		Not relevant		A static state is displayed here. The sampling time data is not relevant.

Fig. 3-4 1030 – Handling BICO technology

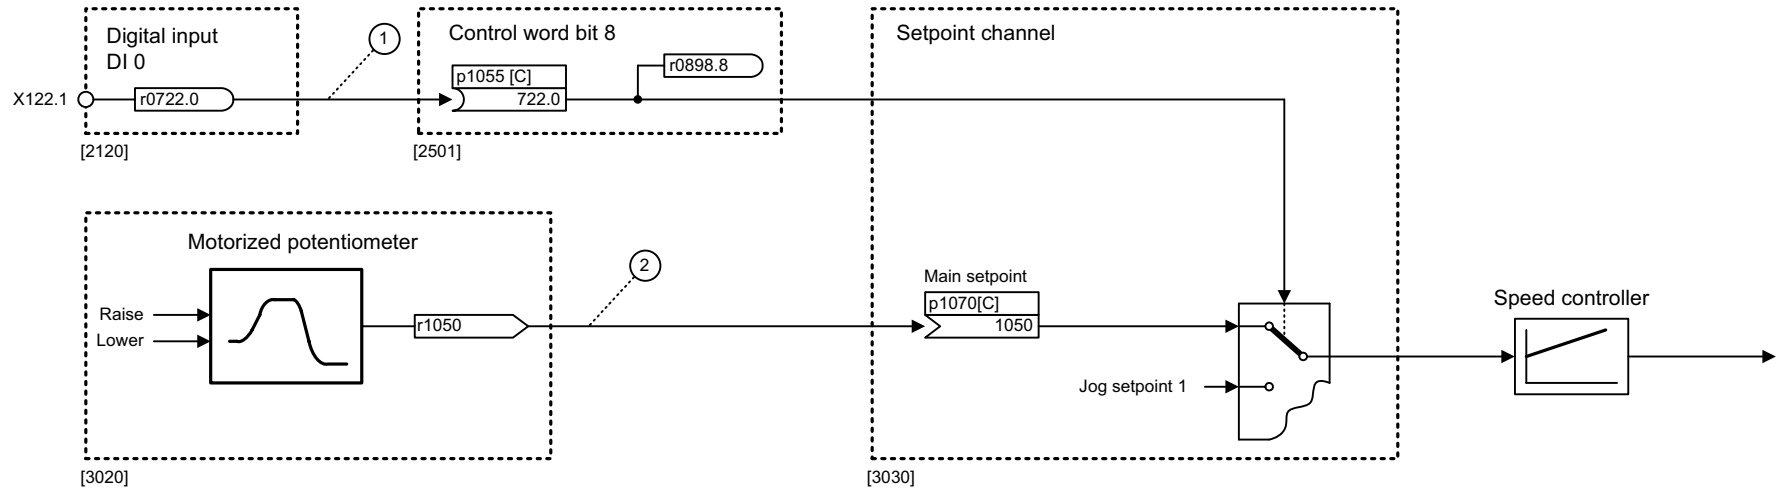

**Handling BICO technology**

**Binector:**  r0723.15 Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

**Connector:**  r0723 Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

**Parameterization:**  
At the signal destination, the required binector or connector is selected using appropriate parameters:  
"BI:" parameter for binectors (BI = Binector Input)  
or  
"CI:" parameter for connectors (CI = Connector Input)

**Example:**  
The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

- Parameterizing steps:**
- ① p1055[0] = 722.0 Terminal X122.1 acts as "Jog bit 0".
  - ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

## 3.9 Brake control

### Function diagrams

2701 – Basic brake control (r0108.14 = 0)	1226
2704 – Extended brake control, zero-speed detection (r0108.14 = 1)	1227
2707 – Extended brake control, open/close brake (r0108.14 = 1)	1228
2711 – Extended brake control, signal outputs (r0108.14 = 1)	1229

---

<1> Motor holding brake configuration (p1215)  
 0 = No motor holding brake being used.  
 1 = Motor holding brake acc. to sequence control.  
 2 = Motor holding brake always released.  
 3 = Motor holding brake like sequence control, connection via BICO.

<2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.

<3> If p1215 = 0, 2 -> t = 0 ms.

<4> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).

<5> For p1227 = 300 s, the monitoring function is deactivated.

<6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.

<7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or power-on inhibit).  
 The signal generation is shown simplified.

<8> The internal signal includes signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).

<9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.

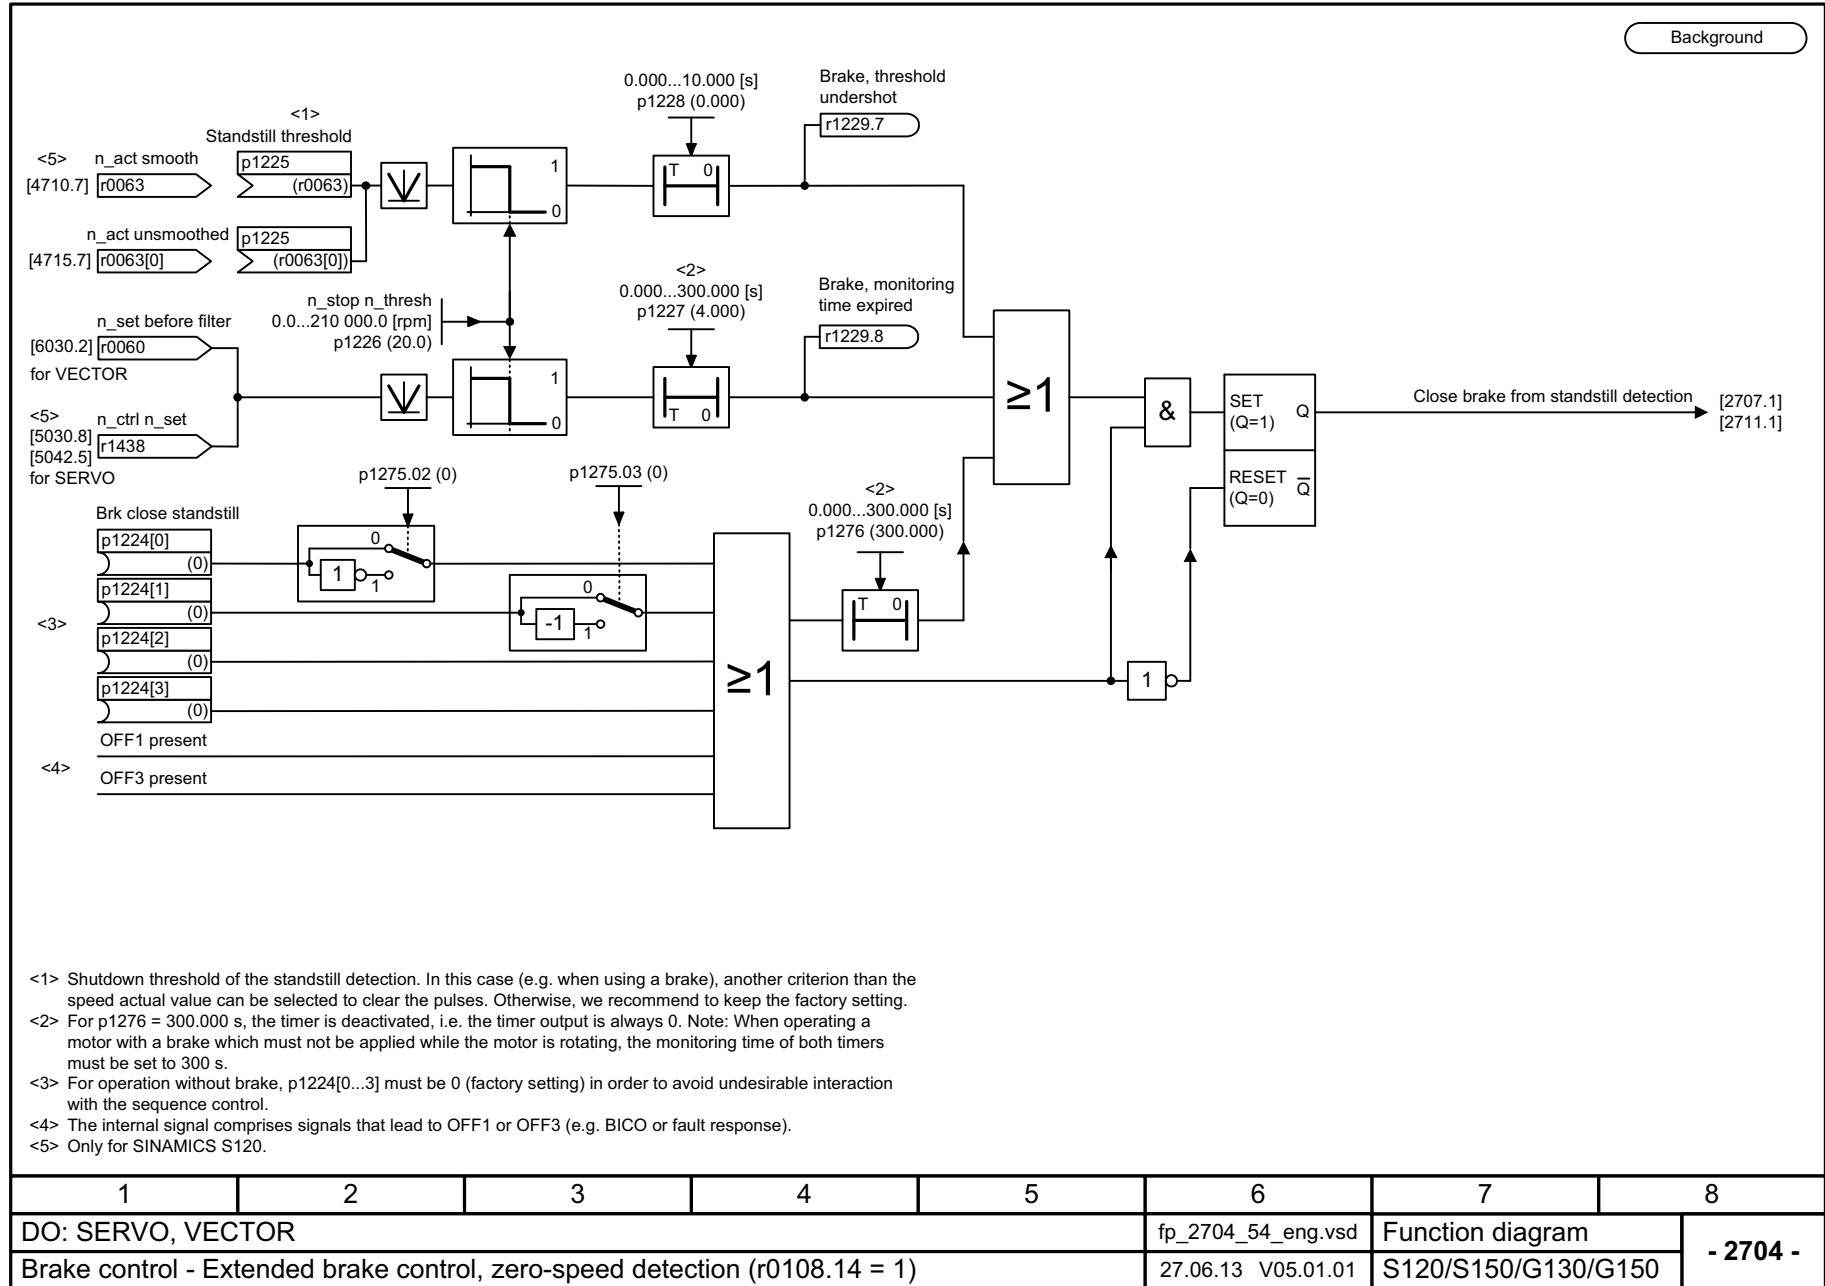

<10> Only for SINAMICS S120.

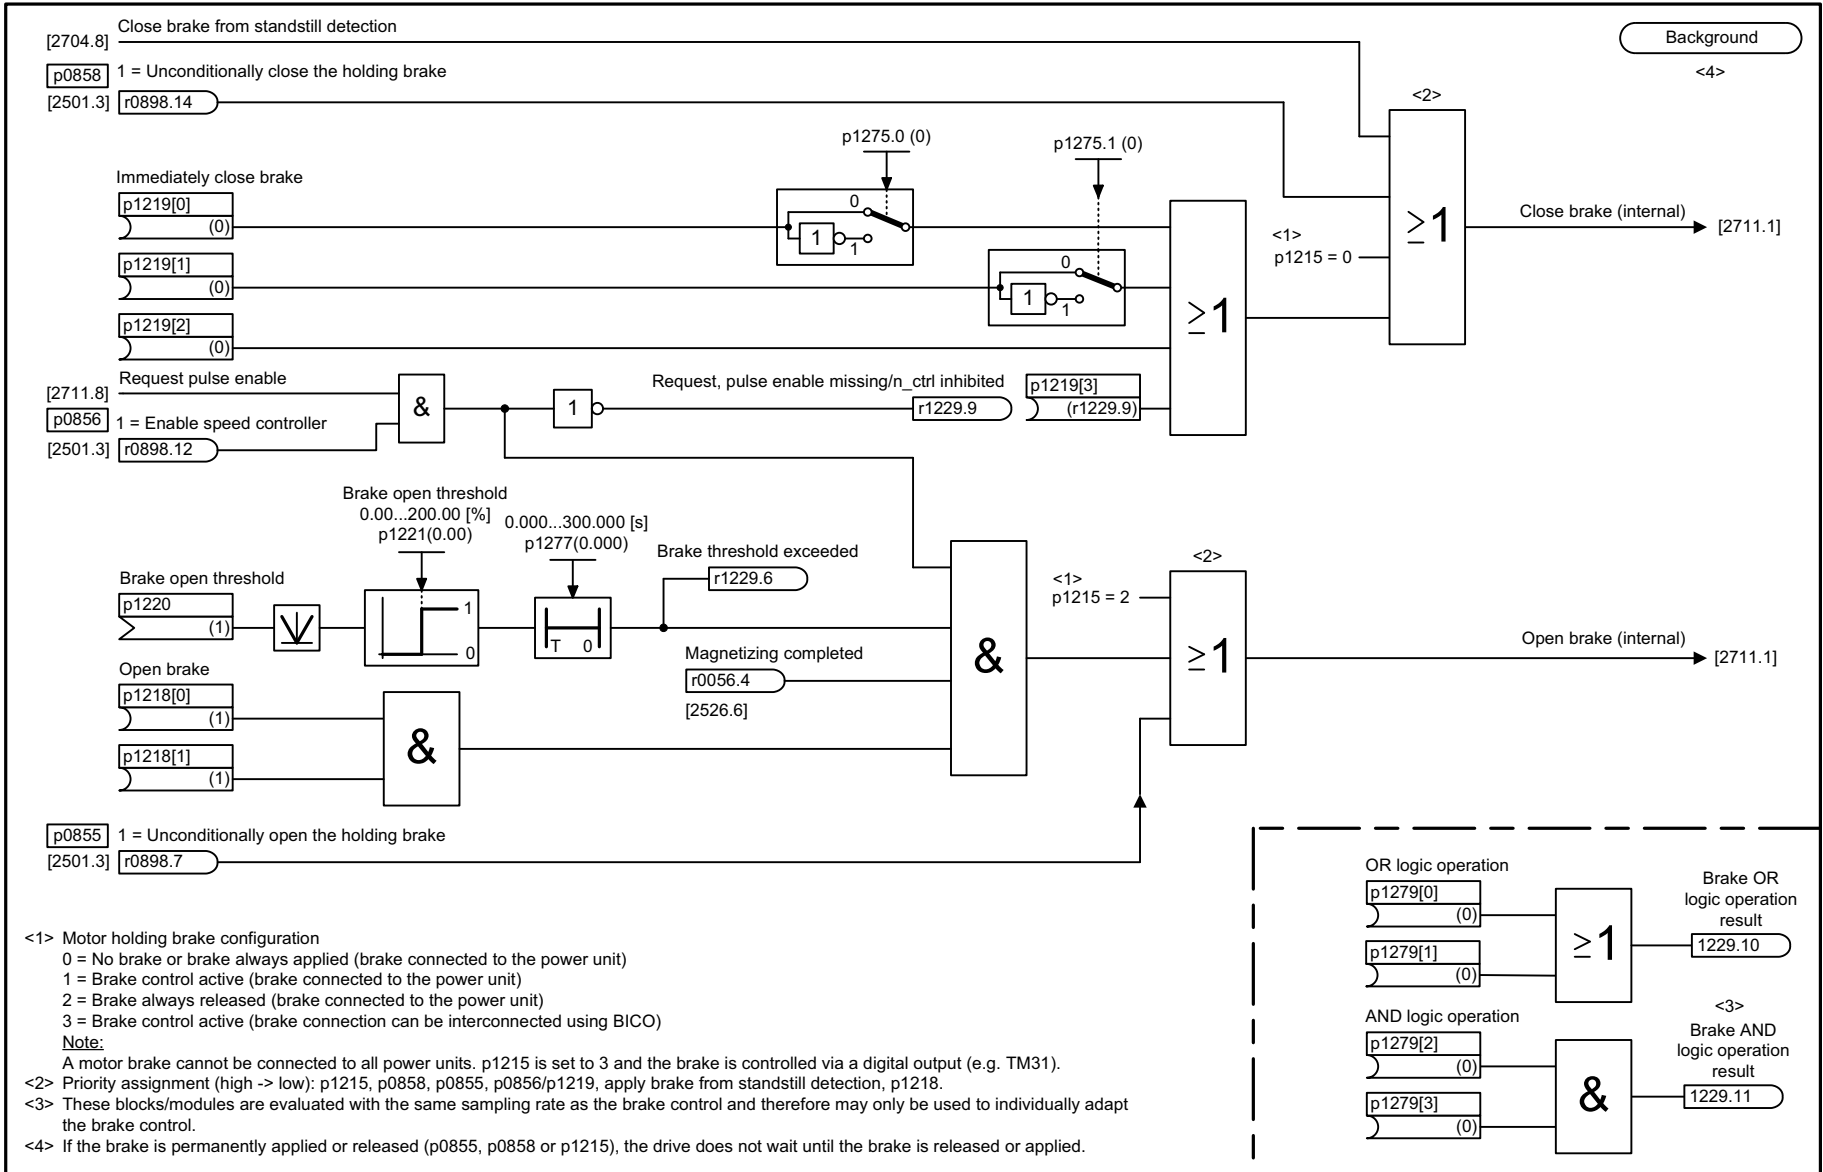

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay). <10>  
 Note: With VECTOR with activated "parallel circuit" Function Module (r0108.15 = 1), the holding brake may only be connected to a power unit (p7015).

Fig. 3-76 2704 – Extended brake control, zero-speed detection (r0108.14 = 1)

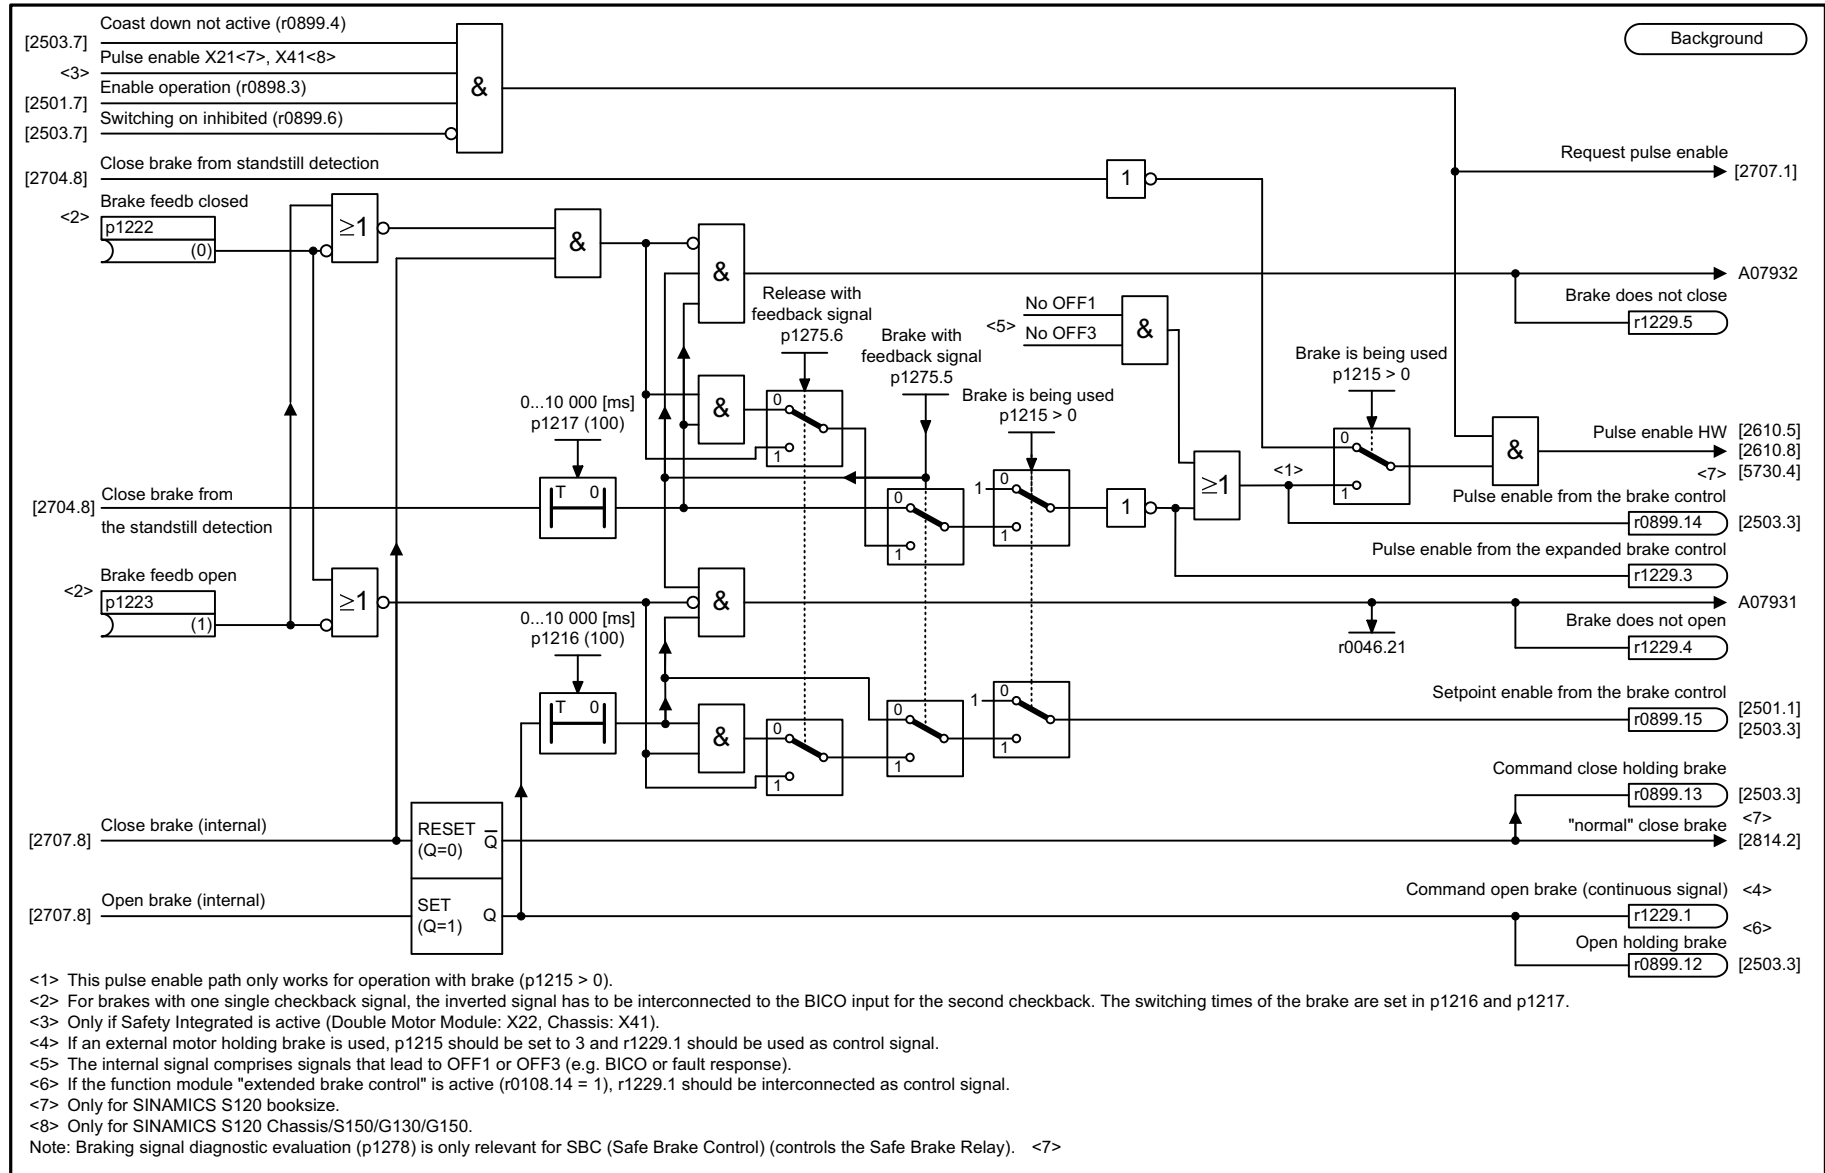

<1> Motor holding brake configuration  
 0 = No brake or brake always applied (brake connected to the power unit)  
 1 = Brake control active (brake connected to the power unit)  
 2 = Brake always released (brake connected to the power unit)  
 3 = Brake control active (brake connection can be interconnected using BICO)  
 Note:  
 A motor brake cannot be connected to all power units. p1215 is set to 3 and the brake is controlled via a digital output (e.g. TM31).  
 <2> Priority assignment (high -> low): p1215, p0858, p0855, p0856/p1219, apply brake from standstill detection, p1218.  
 <3> These blocks/modules are evaluated with the same sampling rate as the brake control and therefore may only be used to individually adapt the brake control.  
 <4> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait until the brake is released or applied.

							- 2707 -

Fig. 3-78 2711 – Extended brake control, signal outputs (r0108.14 = 1)

<1> This pulse enable path only works for operation with brake (p1215 > 0).  
 <2> For brakes with one single checkback signal, the inverted signal has to be interconnected to the BICO input for the second checkback. The switching times of the brake are set in p1216 and p1217.  
 <3> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).  
 <4> If an external motor holding brake is used, p1215 should be set to 3 and r1229.1 should be used as control signal.  
 <5> The internal signal comprises signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).  
 <6> If the function module "extended brake control" is active (r0108.14 = 1), r1229.1 should be interconnected as control signal.  
 <7> Only for SINAMICS S120 booksize.  
 <8> Only for SINAMICS S120 Chassis/S150/G130/G150.  
 Note: Braking signal diagnostic evaluation (p1278) is only relevant for SBC (Safe Brake Control) (controls the Safe Brake Relay). <7>

## 4.1 Overview of faults and alarms

### 4.1.1 General information on faults and alarms

#### Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Display online using the commissioning software.

#### Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault reaction is triggered.</li> <li>• Status signal ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults eliminated?</p> <ul style="list-style-type: none"> <li>• Remove the original cause of the fault.</li> <li>• Acknowledge the fault.</li> </ul>
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status signal ZSW1.7 is set.</li> <li>• The alarm is entered in the alarm buffer.</li> </ul> <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. If the cause of the alarm is no longer present, it automatically reset itself.</li> </ul>

## Fault reactions

### Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFdrive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs.</p> <p><b>Note</b></p> <p>When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies:</p> <p>When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	<p><b>Closed-loop speed control (p1300 = 20, 21)</b></p> <ul style="list-style-type: none"> <li>• n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121).</li> <li>• When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires.</li> </ul> <p>Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint &lt;= speed threshold (p1226) has expired.</p> <p><b>Torque control (p1300 = 23)</b></p> <ul style="list-style-type: none"> <li>• The following applies for torque control: Reaction as for OFF2.</li> <li>• When the system switches to torque control with p1501, the following applies: No separate braking reaction.</li> </ul> <p>If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.</p>
OFF1_ DELAYED	-	As for OFF1, however delayed	<p>Faults with this fault reaction only become effective after the delay time in p3136 has expired.</p> <p>The remaining time up to OFF1 is displayed in r3137.</p>
OFF2	COAST STOP	Internal/external pulse inhibit	<p><b>Closed-loop speed and torque control</b></p> <ul style="list-style-type: none"> <li>• Instantaneous pulse suppression, the drive "coasts" to a standstill.</li> <li>• The motor holding brake (if one is being used) is closed immediately.</li> <li>• Switching on inhibited is activated.</li> </ul>

## Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been removed.

Table 4-3 Acknowledging faults

Acknowledgment	Description								
POWER ON	<p>The fault is acknowledged by a POWER ON (switch drive unit off and on again).</p> <p><b>Note</b> If this action has not eliminated the fault cause, the fault is displayed again immediately after power up.</p>								
IMMEDIATELY	<p>Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows:</p> <p>1 Acknowledge by setting parameter: p3981 = 0 --&gt; 1</p> <p>2 Acknowledge via binector inputs:</p> <table> <tr> <td>p2103</td> <td>BI: 1. PULSE INHIBIT	<p>The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0).</p> <p>The same options are available for acknowledging as described under acknowledge IMMEDIATELY.</p>								

## Fault buffer - saved when switching off

The contents of the fault buffer are saved to the non-volatile memory when the Control Unit is switched off, i.e. the fault buffer history is still available when the unit is switched on again.

The fault buffer of a drive object comprises the following parameters:

- r0945[0...63], r0947[0...63], r0948[0...63], r0949[0...63]
- r2109[0...63], r2130[0...63], r2133[0...63], r2136[0...63]

The fault buffer contents can be deleted manually as follows:

- Delete fault buffer for all drive objects:  
p2147 = 1 --> p2147 = 0 is automatically set after execution.
- Delete fault buffer for a specific drive object:  
p0952 = 0 --> The parameter belongs to the specified drive object.

The fault buffer contents are automatically deleted when the following occurs:

- Restore factory setting (p0009 = 30 and p0976 = 1).
- Download with modified structure (e.g. number of drive objects changed).
- Power-up after other parameter values have been loaded (e.g. p0976 = 10).
- Upgrade firmware to later version.

<b>Axxxxx (F, N)</b>	<b>Alarm xxxxx (message type can be changed to F or N)</b>
<b>Fxxxxx</b>	<b>Fault xxxxx</b>
<b>Fxxxxx (A, N)</b>	<b>Fault xxxxx (report type can be changed to A or N)</b>
<b>Nxxxxx</b>	<b>No message</b>
<b>Nxxxxx (A)</b>	<b>No message (message type can be changed to A)</b>
<b>Cxxxxx</b>	<b>Safety message (separate message buffer)</b>

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information about reaction and acknowledgment is specified independently for a message with adjustable message type (e.g. reaction to F, acknowledgment to F).

---

#### Note

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms" (Page 1417) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

---

#### Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

#### Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

#### Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

#### Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 1411)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)
  - Specifies the "Channel error type" of the PROFINET channel diagnostics.
  - When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)
  - Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.
  - When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)
  - Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.
  - When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

- ET 200 (dec)

Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.

When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.

- NAMUR (r3113.x)

Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

<b>Internal (DRIVE-CLiQ) communication faulted (12)</b> The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles.	900B	11	26	31	10
<b>Infeed fault (13)</b> The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control.	900C	12	27	24	11
<b>Braking controller / Braking Module faulted (14)</b> The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration.	900D	13	28	24	15
<b>Line filter fault (15)</b> The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds).	900E	14	17	24	15
<b>External measured value / signal state outside of the permissible range (16)</b> A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds.	900F	15	29	26	15
<b>Application / technological function faulty (17)</b> The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller.	9010	16	30	9	15

<b>Error in the parameterization/configuration/commissioning procedure (18)</b> An error was identified in the parameterization or in a commissioning procedure, or the parameterization does not match the actual device configuration. Determine the precise cause of the fault using the commissioning tool. Adapt the parameterization or device configuration.	9011	17	31	16	15
<b>General drive fault (19)</b> Group fault. Determine the precise cause of the fault using the commissioning tool.	9012	18	9	9	15
<b>Auxiliary unit fault (20)</b> The monitoring of an auxiliary unit (incoming transformer, cooling unit ...) has detected an illegal state. Determine the exact cause of the fault and check the relevant device.	9013	19	29	26	15

1. Undervoltage condition of the electronics power supply
2. Overvoltage condition of the electronics power supply

### Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

### Component

Type of hardware component that has triggered the fault or alarm.

With "Component: None" it is not possible to assign the message to a hardware component.

### Propagation

In the case of faults that are, for example, triggered by the Control Unit or a Terminal Module, central functions of the drive are also often affected. Using propagation, faults that are triggered by one drive object are therefore passed on to other drive objects.

There are the following types of propagation:

- BICO  
The fault is passed on to all active drive objects with closed-loop control functions (infeed, drive) to which there is a BICO interconnection.
- DRIVE  
The fault is passed on to all active drive objects with closed-loop control functions.
- GLOBAL  
The fault is passed on to all active drive objects.

- LOCAL

The response of this type of propagation is dependent on parameter p3116.

With binector input p3116 = 0 (factory setting) the following applies:

The fault is passed on to the first active drive object with closed-loop control functions.

With binector input p3116 = 1-signal, the following applies:

The fault is not passed on.

#### **Reaction: Default fault reaction (adjustable fault reaction)**

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

---

#### **Note**

See Table "Fault reactions" (Page 1405).

---

#### **Acknowledgment: Default acknowledgment (adjustable acknowledgment)**

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

---

#### **Note**

See Table "Acknowledging faults" (Page 1407).

---

#### **Cause:**

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered into the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

#### **Remedy:**

Description of the methods available for eliminating the cause of the active fault/alarm.

#### **WARNING**

In certain cases, servicing and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

### 4.1.3 Number ranges of faults and alarms

#### Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 1417).

Faults and alarms are organized into the following number ranges:

<b>Message class:</b>	Hardware/software error (1)		
<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	It was not possible to download the firmware to a DRIVE-CLiQ component. Fault value (r0949, interpret hexadecimal): yyxxxx hex: yy = component number, xxxx = fault cause		

xxxx = 000B hex = 11 dec:  
DRIVE-CLiQ component has detected a checksum error.

xxxx = 000F hex = 15 dec:  
The selected DRIVE-CLiQ component did not accept the contents of the firmware file.

xxxx = 0012 hex = 18 dec:  
Firmware version is too old and is not accepted by the component.

xxxx = 0013 hex = 19 dec:  
Firmware version is not suitable for the hardware release of the component.

xxxx = 0065 hex = 101 dec:  
After several communication attempts, no response from the DRIVE-CLiQ component.

xxxx = 008B hex = 139 dec:  
Initially, a new boot loader is loaded (must be repeated after POWER ON).

xxxx = 008C hex = 140 dec:  
Firmware file for the DRIVE-CLiQ component not available on the memory card.

xxxx = 008D hex = 141 dec:  
An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.

xxxx = 008F hex = 143 dec:  
Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.

xxxx = 0090 hex = 144 dec:  
When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.

xxxx = 0091 hex = 145 dec:  
Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.

xxxx = 009C hex = 156 dec:  
Component with the specified component number is not available (p7828).

xxxx = Additional values:  
Only for internal Siemens troubleshooting.

**Remedy:**

- check the selected component number (p7828).
- check the DRIVE-CLiQ wiring.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download firmware again. Depending on p7826, the firmware will be automatically downloaded.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		
<b>Cause:</b>	The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component.		
<b>Remedy:</b>	Update the firmware using the commissioning tool: The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out. Firmware update via parameter: - take the component number from the alarm value and enter into p7828. - start the firmware download with p7829 = 1.

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** All objects  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The project download was interrupted.  
 Fault value (r0949, interpret decimal):  
 1: The user prematurely interrupted the project download.  
 2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).  
 3: The project download was prematurely exited by the commissioning tool.  
 100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card".  
**Note:**  
 The response to an interrupted download is the state "first commissioning".  
**Remedy:**  
 - check the communication cable.  
 - download the project again.  
 - boot from previously saved files (switch-off/switch-on or p0976).  
 - when loading into the file system (download from memory card), use the matching version.

**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2 (NONE)  
**Acknowledge:** IMMEDIATELY  
**Cause:** When converting the project of an older firmware version, an error occurred.  
 Fault value (r0949, interpret decimal):  
 Parameter number of the parameter causing the error.  
 For fault value = 600, the following applies:  
 The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.  
**Notice:**  
 Monitoring of the motor temperature is no longer ensured.  
**Remedy:** Check the parameter indicated in the fault value and correctly adjust it accordingly.  
 For fault value = 600:  
 Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface.  
 Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.  
 Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.  
 Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189.  
 - if necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly.  
 - if necessary, upgrade the firmware to a later version.

<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	At least one system overload has been identified. Fault value (r0949, interpret decimal): 1: Computing time load too high (r9976[1]). 5: Peak load too high (r9976[5]). Note: As long as this fault is present, it is not possible to save the parameters (p0971, p0977). See also: r9976 (System utilization)
<b>Remedy:</b>	For fault value = 1, 5: - reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %. - check the sampling times and adjust if necessary (p0115, p0799, p4099). - deactivate function modules. - deactivate drive objects. - remove drive objects from the target topology. - note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology. When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies: - the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS). - if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001). - if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

<b>Reaction:</b>	OFF2		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	An upgrade (project/firmware download) was initiated on the memory card. While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated. Caution: During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit. If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.		
<b>Remedy:</b>	Not necessary. The fault is automatically withdrawn after the upgrade has been completed.

<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Drive object:</b>	All objects
<b>Component:</b>	None
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The closed-loop control / monitoring cannot maintain the envisaged clock cycle. The runtime of the closed-loop control/monitoring is too long for the particular clock cycle or the computing time remaining in the system is not sufficient for the closed-loop control/monitoring. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	Increase the basic clock cycle of DRIVE-CLiQ communication. See also: p0112 (Sampling times pre-setting p0115)

<b>Cause:</b>	When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified. Alarm value (r2124, interpret decimal): 1: Value lower than minimum value. 2: Value higher than maximum value. 3: Value not a multiple of 1.25 µs. 4: Value does not match isochronous PROFIBUS operation. 5: Value not a multiple of 125 µs. 6: Value not a multiple of 250 µs. 7: Value not a multiple of 375 µs. 8: Value not a multiple of 400 µs. 10: Special restriction of the drive object violated. 20: On a SERVO with a sampling time of 62.5 µs, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted). 21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account). 30: Value less than 31.25 µs. 31: Value less than 62.5 µs (31.25 µs is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).

32: Value less than 125  $\mu$ s.  
33: Value less than 250  $\mu$ s.  
40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125  $\mu$ s. Further, none of the nodes has a sampling time of less than 125  $\mu$ s.  
41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250  $\mu$ s.  
42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125  $\mu$ s.  
43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.  
44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).  
45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5  $\mu$ s or 187.5  $\mu$ s (for a 2x or 3x parallel connection).  
46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.  
52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25  $\mu$ s.  
54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5  $\mu$ s.  
56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125  $\mu$ s.  
58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250  $\mu$ s.  
99: Inconsistency of cross drive objects detected.  
116: Recommended clock cycle in r0116[0...1].  
General note:  
The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).  
The parameters of the sampling times can also be changed with automatic calculations.  
Example for highest common denominator: 125 s, 125  $\mu$ s, 62.5  $\mu$ s --> 62.5  $\mu$ s

**Remedy:**  
- check the DRIVE-CLiQ cables.  
- set a valid sampling time.

#### **A01302 Error in the component trace**

**Message value:** %1

**Message class:** General drive fault (19)

**Drive object:** B\_INF, VECTOR\_G

**Component:** None

**Propagation:** LOCAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error has occurred in the component trace.  
The message appears in the following cases:

- upload trace data (p7792 = 1).
- change factory setting (p7790, p7791) for missing property "component trace" (r0193.1 = 0).

Alarm value (r2124, interpret decimal):

- 1: The DRIVE-CLiQ component does not support the component trace (r0193.1 = 0).
- 101: Data from trace 1 cannot be read.
- 102: Data from trace 2 cannot be read.
- 103: Data from trace 3 cannot be read.
- 104: Data from trace 4 cannot be read.
- 105: Data from trace 5 cannot be read.

**Remedy:** For alarm value = 1:  
Upgrade the firmware of the DRIVE-CLiQ component involved.

#### **F01303 Component does not support the required function**

**Message value:** %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** All objects

**Component:** None

**Propagation:** BICO

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.  
Fault value (r0949, interpret decimal):

- 1: The component does not support the deactivation.
- 101: The Motor Module does not support an internal armature short-circuit.
- 102: The Motor Module does not support the deactivation.
- 201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.
- 202: The Sensor Module does not support parking/unparking.
- 203: The Sensor Module does not support the deactivation.
- 204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.
- 205: The Sensor Module does not support the selected temperature evaluation (r0458, r0459).
- 206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.
- 207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.
- 208: The Sensor Module does not support de-selection of commutation with zero mark (via p0430.23).
- 211: The Sensor Module does not support single-track encoders (r0459.10).
- 212: The Sensor Module does not support LVDT sensors (p4677.0).
- 213: The Sensor Module does not support the characteristic type (p4662).
- 214: The power unit does not support the temperature evaluation via PT1000 (r0193).
- 215: The Terminal Module does not support the temperature evaluation via PT1000
- 216: The Voltage Sensing Module (VSM) does not support operation with a PT1000 temperature sensor.

**Remedy:** Upgrade the firmware of the DRIVE-CLiQ component involved.  
For fault value = 205, 214, 215:  
- check parameter p0600 and p0601 and if required, adapt.

- For fault value = 207:  
- replace the power unit or if required set the device supply voltage higher (p0210).  
For fault value = 208:  
- check parameter p0430.23 and reset if necessary.  
For fault value = 216:  
- check the setting of the sensor type (p3665).  
- use a Voltage Sensing module that supports operation with PT1000 (MLFB ...-xxx1).

## 4 Faults and alarms

### 4.2 List of faults and alarms

aa = 06 hex = 6 dec:

On one component illegal EEPROM data was detected. These must be corrected before the system continues to boot.

- bb = 01 hex = 1 dec: The Article No. [MLFB] of the power unit that was replaced includes a space retainer. The space retainer (\*) must be replaced by a correct character.

- cccc = preliminary component number of the component with illegal EEPROM data.

aa = 07 hex = 7 dec:

The actual topology contains an illegal combination of components.

- bb = 01 hex = 1 dec: Active Line Module (ALM) and Basic Line Module (BLM).

- bb = 02 hex = 2 dec: Active Line Module (ALM) and Smart Line Module (SLM).

- bb = 03 hex = 3 dec: SIMOTION control (e.g. SIMOTION D445) and SINUMERIK component (e.g. NX15).

- bb = 04 hex = 4 dec: SINUMERIK control (e.g. SINUMERIK 730.net) and SIMOTION component (e.g. CX32).

- cccc: Not used.

aa = 08 hex = 8 dec:

The motor is not completely connected.

- bb: Not used.

- cccc: Not used.

Note:

Connection type and connection number are described in F01375.

#### Remedy:

- adapt the output topology to the permissible requirements.

- commission the device using the commissioning tool.

- for motors with DRIVE-CLiQ, connect the power and DRIVE-CLiQ cable to the same Motor Module (Single Motor Module: DRIVE-CLiQ at X202, Double Motor Module: DRIVE-CLiQ from motor 1 (X1) to X202, from motor 2 (X2) to X203).

For aa = 06 hex = 6 dec and bb = 01 hex = 1 dec:

Correct the Article No. when commissioning using the commissioning tool.

<b>F01355</b>	<b>Topology: Actual topology changed</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Drive object:</b>	All objects
<b>Component:</b>	None
<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The device target topology (p0099) does not correspond to the device actual topology (r0098). The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning tool. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: r0098 (Actual device topology), p0099 (Device target topology)
<b>Remedy:</b>	One of the following counter-measures can be selected if no faults have occurred in the topology detection itself: If commissioning is still not completed: - carry out a self-commissioning routine (starting from p0009 = 1). In general: Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107). Generating servo drives: Set p0097 to 1, set p0009 to 0. Generating vector drives: Set p0097 to 2, set p0009 to 0. Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0. In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).

If commissioning has already been completed:

- re-establish the original connections and re-connect power to the Control Unit.
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.
- change the device parameterization to match the connections (this is only possible using the commissioning tool).

Notice:

Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning tool and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

<b>Drive object:</b>	All objects		
<b>Component:</b>	None	<b>Propagation:</b>	BICO
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		
<b>Cause:</b>	There are BICO interconnections to an inactive/inoperable drive object. The BI/CI parameters involved are listed in r9498. The associated BO/CO parameters are listed in r9499. The list of the BICO interconnections to other drive objects is displayed in r9491 and r9492 of the deactivated drive object. Note: r9498 and r9499 are only written to, if p9495 is not set to 0. Alarm value (r2124, interpret decimal): Number of BICO interconnections found to inactive drive objects.		
<b>Remedy:</b>	- set all open BICO interconnections centrally to the factory setting with p9495 = 2. - make the non-operational drive object active/operational again (re-insert or activate components).

<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Drive object:</b>	All objects
<b>Component:</b>	None
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The maximum number of BICO interconnections (signal sinks) when deactivating a drive object was exceeded. When deactivating a drive object, all BICO interconnections (signal sinks) are listed in the following parameters: - r9498[0...29]: List of the BI/CI parameters involved. - r9499[0...29]: List of the associated BO/CO parameters.
<b>Remedy:</b>	Not necessary. This alarm is automatically withdrawn as soon as no BICO interconnection is entered in r9498[29] and r9499[29] (value = 0). Notice: When re-activating the drive object, all BICO interconnections should be checked and if required, re-established.

<b>Cause:</b>	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. - the BICO output has different normalized units than the BICO input. - message only for interconnections within a drive object. Example: The BICO output has, as normalized unit, voltage and the BICO input has current. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).

<b>Propagation:</b>	BICO
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.  An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input. p2002: contains the reference value for current p2001: contains the reference value for voltage Example 2: BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input. p2001: contains the reference value for voltage, drive objects 1, 2 Fault value (r0949, interpret decimal): Parameter number of the BICO input (signal sink).

**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The drive-integrated "Safety Integrated" function on the Control Unit (CU) has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of the Control Unit).  
 - forced checking procedure (test stop) of the safety switch-off signal path of the Control Unit unsuccessful.  
 - subsequent response to fault F01611 (defect in a monitoring channel).  
 Fault value (r0949, interpret decimal):  
 0: Stop request from monitoring channel 2.  
 1005:  
 - STO active, although STO not selected and there is no internal STOP A active.  
 - For a Power Module with "STO via terminals at the Power Module" (STO\_A/STO\_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0).  
 1010: STO inactive although STO is selected or an internal STOP A is present.

<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE (OFF1, OFF2, OFF3)		
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)		
<b>Cause:</b>	The drive-integrated "Safety Integrated" function on processor 1 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F. As a result of this fault, after the parameterized transition has expired (p9658), fault F01600 (SI CU: STOP A initiated) is output. Fault value (r0949, interpret decimal): 0: Stop request from another monitoring channel. 1 ... 999: Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795. 1: SI monitoring clock cycle (r9780, r9880). 2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits. 3: SI SGE changeover discrepancy time (p9650, p9850). 4: SI transition period STOP F to STOP A (p9658, p9858). 5: SI enable Safe Brake Control (p9602, p9802). 6: SI Motion enable, safety-relevant functions (p9501, internal value). 7: SI delay time of STO for Safe Stop 1 (p9652, p9852). 8: SI PROFIsafe address (p9610, p9810). 9: SI debounce time for STO/SBC/SS1 (p9651, p9851). 10: SI delay time for initiating STO for ESR (p9697, p9897). 11: SI Safe Brake Adapter mode, BICO interconnection (p9621, p9821). 12: SI Safe Brake Adapter relay ON time (p9622[0], p9822[0]). 13: SI Safe Brake Adapter relay OFF time (p9622[1], p9822[1]). 14: SI PROFIsafe telegram selection (p9611, p9811). 15: SI PROFIsafe bus failure response (p9612, p9812). 1000: Watchdog timer has expired. Within the time of approx. 5 x p9650, alternatively, the following was defined: - the signal at terminal EP of the Motor Module continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850). - via PROFIsafe/TM54F, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850). - safe pulse cancellation (r9723.9 - also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850). 1001, 1002: Initialization error, change timer / check timer. 1900: CRC error in the SAFETY sector. 1901: CRC error in the ITCM sector. 1902: Overloading in the ITCM sector has occurred in operation. 1903: Internal parameterizing error for CRC calculation.		

1950: Module temperature outside the permissible temperature range.  
1951: Module temperature not plausible.  
2000: Status of the STO selection for both monitoring channels different.  
2001: Feedback signal of STO shutdown for both monitoring channels different. This value can also subsequently occur as a result of other faults.  
2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).  
2003: Status of the STO terminal for both monitoring channels different.  
2004: Status of the STO selection for Motor Modules connected in parallel different.  
2005: Feedback signal of the safe pulse suppression on the Control Unit and Motor Modules connected in parallel different.  
6000 ... 6999:  
Error in the PROFIsafe control.  
For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.  
6000: A fatal PROFIsafe communication error has occurred.  
6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.  
6064: Destination address and PROFIsafe address are different (F\_Dest\_Add).  
6065: Destination address not valid (F\_Dest\_Add).  
6066: Source address not valid (F\_Source\_Add).  
6067: Watchdog time not valid (F\_WD\_Time).  
6068: Incorrect SIL level (F\_SIL).  
6069: Incorrect F-CRC length (F\_CRC\_Length).  
6070: Incorrect F parameter version (F\_Par\_Version).  
6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.  
6072: F parameterization is inconsistent.  
6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.  
6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

**Remedy:**

For fault value = 1 ... 5 and 7 ... 999:  
- check the cross data comparison that resulted in a STOP F.  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade the Motor Module software.  
- upgrade the Control Unit software.  
For fault value = 6:  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade the Motor Module software.  
- upgrade the Control Unit software.  
For fault value = 1000:  
- check the EP terminal at the Motor Module (contact problems).  
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.  
- check the wiring of the failsafe inputs at the TM54F (contact problems).  
- check the discrepancy time, and if required, increase the value (p9650/p9850).  
For fault value = 1001, 1002:  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade the Motor Module software.  
- upgrade the Control Unit software.  
For fault value = 1900, 1901, 1902:  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade the Control Unit software.  
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003, 2004, 2005:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F\_Source\_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F\_WD\_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F\_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F\_CRC\_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F\_Par\_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F\_CRC\_Length and F\_Par\_Version:

F\_CRC\_Length = 2-byte CRC and F\_Par\_Version = 0

F\_CRC\_Length = 3-byte CRC and F\_Par\_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 1000:

- check the Safety Integrated Basic Functions (r9780) and adapt the reference checksum (p9799).
- again carry out safety commissioning routine.
- replace the memory card or Control Unit.
- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

For fault value = 2000:

- check the safety parameters on monitoring channel 1 and adapt the reference checksum (p9799).

For fault value = 2001:

- check the safety parameters on monitoring channel 2 and adapt the reference checksum (p9899).

For fault value = 2002:

- check the enable the safety-related functions on both monitoring channels (p9601 = p9801).

For fault value = 2003, 2004, 2005:

- carry out an acceptance test and generate an acceptance report.

For motion monitoring functions that are enabled ( $p9601.2 = p9801.2 = 1$  and/or  $p9501 > 0$ ), the following applies:

100:

- no matching monitoring clock cycle was able to be found.
- an illegal actual value sensing clock cycle was set for S120M ( $p9511$ ).

101:

- the monitoring clock cycle is not an integer multiple of the actual value sensing clock cycle.
- SINAMICS S120M: the monitoring clock cycle ( $p9500$ ) is not an integer multiple of 2 ms.

102:

- An error has occurred when transferring the actual value sensing clock cycle to the Motor Module.

103:

- An error has occurred when transferring the actual value sensing clock cycle to the Sensor Module.

104, 105:

- four times the current controller sampling time ( $p0115[0]$ ) is greater than 1 ms when operating with a non-isochronous PROFIBUS.
- four times the current controller sampling time ( $p0115[0]$ ) is greater than the DP clock cycle when operating with an isochronous PROFIBUS.
- the DP clock cycle is not an integer multiple of the sampling time of the current controller ( $p0115[0]$ ).

106:

- the monitoring clock cycle does not match the monitoring clock cycle of the TM54F.

107:

- the actual value sensing clock cycle ( $p9511$ ) is less than four times the current controller sampling time ( $p0115[0]$ ).
- the actual value sensing clock cycle ( $p9511$ ) is not an integer multiple of the sampling time of the current controller ( $p0115[0]$ ).

108:

- the parameterized actual value sensing clock cycle cannot be set on this component

109:

- if the motion monitoring functions have been parameterized as encoderless ( $p9506$ ), the actual value sensing clock cycle ( $p9511$ ) and the current controller clock cycle ( $p0115[0]$ ) must be identical.
- SINAMICS S110: if the motion monitoring functions have been parameterized as encoderless ( $p9506$ ), the actual value sensing clock cycle  $p9511$  must be = 250  $\mu$ s.

110:

- the actual value sensing clock cycle ( $p9511$ ) for safety with encoder ( $p9506 = 0$ ) is less than 2 ms for this Control Unit (e.g. CU305).

111:

- the monitoring clock cycle is not an integer multiple of the sampling time of the current controller ( $p0115[0]$ ).

112:

- An actual value sensing clock cycle  $p9511 = 0$  on a drive object of a Double Motor Module is not permissible in the existing configuration.

200, 201:

- S120M: the monitoring clock cycle cannot be maintained as a result of the conditions required in the system.

202:

- the current controller sampling time is set to zero ( $p0115[0]$ ).

**Remedy:**

For enabled SI monitoring integrated in the drive ( $p9601/p9801 > 0$ ):

- upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function ( $p9501 > 0$ ):

- correct the monitoring clock cycle ( $p9500$ ) and carry out POWER ON.

For fault value = 100:

- for S120M, set the actual value sensing clock cycle to  $p9511 = 0$ .

For fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).
- for motion monitoring functions integrated in the drive ( $p9601/p9801\text{bit } 2 = 1$ ) the actual value sensing clock cycle can be directly parameterized in  $p9511/p9311$ .
- SINAMICS S120M: set the monitoring clock cycle ( $p9500$ ) to an integer multiple of 2 ms.

## 4 Faults and alarms

### 4.2 List of faults and alarms

For fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.
- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.
- increase the DP clock cycle for operation with an isochronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.
- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500/p9300).

For fault value = 107:

- set an actual value sensing clock cycle that matches the current controller clock cycle (p9511  $\geq 4 * p0115[0]$ ,  $8 * p0115[0]$ ) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.
- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).
- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p0115[0]).
- SINAMICS S110: set the actual value sensing clock cycle to p9511 = 250 µs.

For fault value = 110:

- set the actual value sensing clock cycle in p9511 to 2 ms or higher.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

For fault value = 200, 201:

- increase the current controller sampling time (p0115[0]).
- if required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

**Cause:**

There is a PROFIBUS/PROFINET configuration error for using Safety Integrated monitoring functions with a higher-level control (SINUMERIK or F-PLC).

Note:

For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

200: A safety slot for receive data from the control has not been configured.

210, 220: The configured safety slot for the receive data from the control has an unknown format.

230: The configured safety slot for the receive data from the F-PLC has the incorrect length.

231: The configured safety slot for the receive data from the F-PLC has the incorrect length.

240: The configured safety slot for the receive data from the SINUMERIK has the incorrect length.

250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive.

300: A safety slot for the send data to the control has not been configured.

310, 320: The configured safety slot for the send data to the control has an unknown format.

330: The configured safety slot for the send data to the F-PLC has the incorrect length.

331: The configured safety slot for the send data to the F-PLC has the incorrect length.

340: The configured safety slot for the send data to the SINUMERIK has the incorrect length.

400: The telegram number in the F-PLC does not match the parameterization in the drive.

**Remedy:**

The following generally applies:

- check and, if necessary, correct the PROFIBUS/PROFINET configuration of the safety slot on the master side.

- upgrade the Control Unit software.

For fault value = 250:

- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.

For fault value = 231, 331:

- in the drive, parameterize the appropriate PROFIsafe telegram (p9611/p9811) to be set on the F-PLC and to be set in p60022.

- Configure the PROFIsafe telegram matching the parameterization (p9611/p9811) in the F-PLC.

<b>F01663</b>	<b>SI P1 (CU): Copying the SI parameters rejected</b>
<b>Message value:</b>	-
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	None
<b>Propagation:</b>	DRIVE
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	In p9700, the value 87 or 208 is saved or was entered offline. This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from monitoring channel 1 to monitoring channel 2. However, no safety-relevant function has been selected in monitoring channel 1 (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons. As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages. Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output.

Note:  
This fault does not result in a safety stop response.  
SI: Safety Integrated  
See also: p9700 (SI Motion copy function)

- Remedy:**
- set p9700 to 0.
  - check p9501 and p9601 and if required, correct.
  - restart the copying function by entering the corresponding value into p9700.
- Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode:
- call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated").
  - click on "Change settings".
  - click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels).
  - save all parameters (p0977 = 1 or "copy RAM to ROM").
  - carry out a POWER ON (switch-off/switch-on) for all components.

**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** DRIVE  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled.

Note:  
This fault does not result in a safety stop response.  
See also: p7826 (Firmware update automatic)

- Remedy:**
- When safety functions are enabled (p9501 <> 0 and/or p9601 <> 0):
1. Activate the "Firmware update automatic" function (p7826 = 1).
  2. Backup the parameters (p0977 = 1) and carry out a POWER ON.
- When deactivating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2		
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)		
<b>Cause:</b>	The parameterization of a Sensor Module used for Safety Integrated is not permissible. Note: This fault results in a STOP A that cannot be acknowledged.		

Fault value (r0949, interpret decimal):

- 1: No encoder was parameterized for Safety Integrated.
- 2: An encoder was parameterized for Safety Integrated that does not have an A/B track (sine/cosine).
- 3: The encoder data set selected for Safety Integrated is still not valid.
- 4: A communication error with the encoder has occurred.
- 5: Number of relevant bits in the encoder coarse position invalid.
- 6: DRIVE-CLiQ encoder configuration invalid.
- 7: Non-safety relevant component of the encoder coarse position for the linear DRIVE-CLiQ encoder not valid.
- 8: Parameterized Safety comparison algorithm not supported.
- 9: Relationship between the grid division and measuring step for linear DRIVE-CLiQ encoder is not binary.
- 10: For an encoder used for Safety Integrated, not all of the Drive Data Sets (DDS) are assigned to the same Encoder Data Set (EDS) (p0187 ... p0189).
- 11: The zero point setting of a linear DRIVE-CLiQ encoder used in Safety Integrated is not zero.
- 12: The second encoder is not parameterized (p9526 = 1 is not permissible).
- 13: Hydraulic Module: A second encoder has not been parameterized and a DRIVE-CLiQ encoder is not being used.
- 14: SCSE encoder is used in conjunction with an HTL/TTL encoder, another SCSE encoder or in a 1-encoder system.

**Remedy:**

For fault value = 1, 2:

- use and parameterize an encoder that Safety Integrated supports (encoder with track A/B sine-wave, p0404.4 = 1).

For fault value = 3:

- check whether the drive or drive commissioning function is active and if required, exit this (p0009 = p00010 = 0), save the parameters (p0971 = 1) and carry out a POWER ON

For fault value = 4:

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Sensor Module involved and if required, carry out a diagnostics routine for the faults identified.

For fault value = 5:

- p9525 = 0 (not permissible). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 6:

- check p9515.0 (for DRIVE-CLiQ encoders, the following applies: p9515.0 = 1). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 7:

- p12033 for an encoder used for Safety Integrated is not equal to 1. Use a linear DRIVE-CLiQ encoder and parameterize for p12033 = 1.

For fault value = 8:

- check p9541. Use and parameterize an encoder that implements an algorithm supported by Safety Integrated.

For fault value = 9:

- check p9514 and p9522. Use an encoder and parameterize, where the ratio between p9514 and p9522 is binary.

For fault value = 10:

- align the EDS assignment of all of the encoders used for Safety Integrated (p0187 ... p0189).

For fault value = 11:

- use and parameterize a linear DRIVE-CLiQ encoder, where the zero point setting is equal to 0.

For fault value = 12:

- parameterize an encoder for the second channel (p9526 > 1).

For fault value = 13:

- parameterize a second encoder or use a DRIVE-CLiQ encoder.

<b>Cause:</b>	For the "Safe synchronous position via PROFIsafe" function, an incorrect configuration setting was identified. Note: This fault results in a STOP A that can be acknowledged in the following way. - select STO and then de-select again. - internal event acknowledge (if the "Extended message acknowledgment" is active, p9507.0 = 1). Fault value (r0949, decimal interpretation): 1: "Synchronous safe position via PROFIsafe" is enabled (p9501.29 = 1) and is not set according to the rule $Tdp = 2 \times n \times p9500$ ( $n = 1, 2, 3, \dots$ ). 2: "Synchronous safe position via PROFIsafe" is enabled (p9501.29 = 1) and isochronous operation is not set. Note: STO: Safe Torque Off		
<b>Remedy:</b>	For fault value = 1: - set Tdp and monitoring clock cycle p9500 according to the rule $Tdp = 2 \times n \times p9500$ . ( $n = 1, 2, 3, \dots$ ) For fault value = 2: - set "Isochronous mode" on the PROFIBUS/PROFINET controller.

xxxx = 9601 and yyyy = 18:

SLA (p9501.20 = 1) is enabled without enabling PROFIsafe.

#### Remedy:

Correct parameter (if required, also on another monitoring channel, p9801).

If xxxx = 9500 and yyyy = 1:

- set p9500 "SI Motion monitoring clock cycle" as an integer multiple of p0115[0] "Current controller sampling time".

- align parameters 9300 and 9500, backup parameters (p0971 = 1) and carry out a POWER ON.

For xxxx = 9500 and yyyy = 16:

Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or set monitoring clock cycle p9500 on all axes the same when the function is enabled.

If xxxx = 9501:

- correct parameters p9501.16 and p9301.16, or deselect the extended functions without selection (p9601.5).

If xxxx = 9501 and yyyy = 8:

Inhibit referencing via SCC (p9501.27) or enable an absolute motion monitoring function (p9501.1 or p9501.2).

If xxxx = 9501 and yyyy = 10:

Inhibit referencing via SCC (p9501.27) or EPOS (r0108.4).

For xxxx = 9501 and yyyy = 11:

Inhibit SS2E (p9501.18) - or enable PROFIsafe.

For xxxx = 9501 and yyyy = 12:

Inhibit SCA (p9501.28) - or enable PROFIsafe.

For xxxx = 9501 and yyyy = 14:  
Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or enable "Safe position via PROFIsafe" (p9501.25).

For xxxx = 9501 and yyyy = 20:  
Inhibit SLA (p9501.20) or activate a 1-encoder system (p9526 equal to 1).

If xxxx = 9505:  
Correct parameter p9501.1 or p9505.

If xxxx = 9507:  
Set synchronous or induction motor according to p0300.

If xxxx = 9506:  
Align parameters p9306 and p9506, back up the parameters (p0971 = 1) and carry out a POWER ON.

If xxxx = 9511:  
Align parameters p9311 and p9511, back up the parameters (p0971 = 1) and carry out a POWER ON.

If xxxx = 9517:  
Parameter p9516.0 should also be checked.

For xxxx = 9319:  
For the SCSE encoder, parameter p9319 must not be set higher than 11.

If xxxx = 9522:  
Correct the corresponding parameter.

If xxxx = 9534 or 9535:  
Reduce the limit values (absolute values) of SLP.

If xxxx = 9544:  
Correct parameter (for linear axes, the maximum value is limited to 1 mm).

If xxxx = 9547:  
With hysteresis/filtering enabled (p9501.16 = 1), the following applies:  
- set parameters p9546 and p9547 according to the following rule:  $p9547 \leq 0.75 \times p9546$   
- if the actual value synchronization is enabled (p9501.3 = 1), then this rule must be complied with:  $p9547 \geq p9549$

For xxxx = 9578:  
- observe the information in r9790.

If xxxx = 9585:  
Correct parameter (if required, also on the second monitoring channel, p9385).

If xxxx = 9601:  
yyyy = 1:  
Only enable motion monitoring functions integrated in the drive (p9601.2 = 1) and extended functions without selection (p9601.5 = 1), or only enable PROFIsafe (p9601.3 = 1) or only onboard F-DI (p9601.4 = 1).

Enable motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 4:  
If onboard F-DI are enabled, then it is not permissible to simultaneously set PROFIsafe and F-DI via PROFIsafe (p9501.30), deselect PROFIsafe functionality or onboard F-DI.

yyyy = 5:  
To transfer the SLS limit values via PROFIsafe (p9501.24 = 1), also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 6:  
For the safe position via PROFIsafe (p9501.25 = 1), also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 7:  
For safe switchover of gearbox stages (p9501.26 = 1) also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).

<b>Drive object:</b>	VECTOR_G		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		
<b>Cause:</b>	The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions. Isochronous PROFIBUS: The sum of Ti and To is too high for the selected DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To. No isochronous PROFIBUS: The DP clock cycle must be at least 4x the current controller clock cycle. Notice: If this alarm is not observed, then message C01711 or C30711 – with the value 1020 ... 1021 – can sporadically occur.		
<b>Remedy:</b>	Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time. Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0): Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual values sensing clock cycle must be at least 4x the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended. **Message value:** -

**Message class:** Safety monitoring channel has identified an error (10)

**Drive object:** VECTOR\_G

**Component:** None **Propagation:** GLOBAL

**Reaction:** NONE (OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

The drive is stopped via a STOP B (braking along the OFF3 deceleration ramp).

As a result of this fault, after the time parameterized in p9556 has expired, or the speed threshold parameterized in p9560 has been undershot, message C01700 "STOP A initiated" is output.

Possible causes:

- stop request from the second monitoring channel.
- subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
- subsequent response to the message C01711 "SI Motion CU: Defect in a monitoring channel".
- subsequent response to the message C01707 "SI Motion CU: tolerance for safe operating stop exceeded".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
- subsequent response to the message C01716 "SI Motion CU: tolerance for safe motion direction exceeded".

**Remedy:**

- remove the cause of the fault on the second monitoring channel.
- carry out a diagnostics routine for message C01714.
- carry out a diagnostics routine for message C01711.

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

Motion monitoring functions with encoder (p9506 = 0) or encoderless with set acceleration monitoring (SAM, p9506 = 3):

- after initiating STOP B (SS1) or STOP C (SS2), the speed has exceeded the selected tolerance.

Motion monitoring functions encoderless with set brake ramp monitoring (SBR p9506 = 1):

- after initiating STOP B (SS1) or SLS changeover to the lower speed level, the speed has exceeded the selected tolerance.

The drive is shut down by the message C01700 "SI Motion: STOP A initiated".

**Remedy:** Check the braking behavior and, if necessary, adapt the parameterization of the parameter settings of the "SAM" or the "SBR" function.

**Drive object:** VECTOR\_G

**Component:** None **Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP E (retraction motion).  
"Safe Operating Stop" (SOS) is activated after the parameterized time has expired.

Possible causes:

- stop request from the higher-level control.
  - subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
  - subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
  - subsequent response to the message C01716 "SI Motion CU: tolerance for safe motion direction exceeded".
- See also: p9554 (SI Motion transition time STOP E to SOS (SBH) (Control Unit))

**Remedy:**

- remove the cause of the fault at the control.
- carry out a diagnostics routine for message C01714/C01715/C01716.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

- 42: Shutdown speed, STO (p9560/p9360)
- 43: Memory test, stop response (STOP A).
- 44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (p9500/p9300).

45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (p9500/p9300).

46: Position actual value (r9713[0/1]) + limit value SLS2 (p9531[1]/p9331[1]) \* safety monitoring clock cycle (p9500/p9300).

47: Position actual value (r9713[0/1]) - limit value SLS2 (p9531[1]/p9331[1]) \* safety monitoring clock cycle (p9500/p9300).

48: Position actual value (r9713[0/1]) + limit value SLS3 (p9531[2]/p9331[2]) \* safety monitoring clock cycle (p9500/p9300).

49: Position actual value (r9713[0/1]) - limit value SLS3 (p9531[2]/p9331[2]) \* safety monitoring clock cycle (p9500/p9300).

50: Position actual value (r9713[0/1]) + limit value SLS4 (p9531[3]/p9331[3]) \* safety monitoring clock cycle (p9500/p9300).

51: Position actual value (r9713[0/1]) - limit value SLS4 (p9531[3]/p9331[3]) \* safety monitoring clock cycle (p9500/p9300).

52: Standstill position + tolerance (p9530/9330)

53: Standstill position - tolerance (p9530/9330)

54: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300) + tolerance (p9542/p9342).

55: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300).

56: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300).

57: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300) - tolerance (p9542/p9342).

58: Actual stop request.

75: Velocity limit nx (p9546, p9346).

When the function "n < nx: hysteresis and filtering" (p9501.16 = 1) is enabled, this message value is also output for a different hysteresis tolerance (p9547/p9347).

76: Stop response for SLS1 (p9563[0]/p9363[0])

77: Stop response for SLS2 (p9563[1]/p9363[1])

78: Stop response for SLS3 (p9563[2]/p9363[2])

79: Stop response for SLS4 (p9563[3]/p9363[3])

- 80: Modulo value for SP for rotary axes (p9505/p9305).
- 81: Velocity tolerance for SAM (p9548/p9348)
- 82: SGEs for SLS correction factor.
- 83: Acceptance test timer (p9558/p9358)
- 84: Trans. time STOP F (p9555/p9355)

- 91: Lower limit value for SCA, cam 5 plus position (p9536[4]/p9336[4]).
- 92: Upper limit value for SCA, cam 5 minus position (p9537[4]/p9337[4]+p9540/p9340).
- 93: Lower limit for SCA, cam 5 minus position (p9537[4]/p9337[4]).
- 94...224: limit value SCA, cams 6 to 30. See above, fault values 90 to 93 for cam 5.
- 225...229: Status screens of the monitoring function SCA (result lists 3...7).
- 230: Filter time constant for  $n < nx$ .
- 231: Hysteresis tolerance for  $n < nx$ .
- 232: Smoothed velocity actual value.
- 233: Limit value  $nx$  / safety monitoring clock cycle + hysteresis tolerance.
- 234: Limit value  $nx$  / Safety monitoring clock cycle.
- 235: -Limit value  $nx$  / Safety monitoring clock cycle.
- 236: -Limit value  $nx$  / safety monitoring clock cycle - hysteresis tolerance.
- 237: SGA  $n < nx$ .
- 238: speed limit value for SAM (p9568/p9368 or p9346/p9346).
- 239: Acceleration for SBR (p9581/p9381 and p9583/p9383).
- 240: Inverse value of acceleration for SBR (p9581/p9381 and p9583/p9383).
- 241: Deceleration time for SBR (p9582/p9382).
- 242: Encoderless safety (p9506/p9306).
- 243: Function configuration (p9507/p9307).
- 244: Encoderless actual value sensing filter time (p9587/p9387).
- 245: Encoderless actual value sensing minimum current (p9588/p9388).
- 246: Voltage tolerance acceleration (p9589/p9389).
- 247: SDI tolerance (p9564/p9364).
- 248: SDI positive upper limit (7FFFFFFF hex).
- 249: Position actual value (r9713[0/1]) - SDI tolerance (p9564/p9364).
- 250: Position actual value (r9713[0/1]) + SDI tolerance (p9564/p9364).
- 251: SDI negative lower limit (80000001 hex).
- 252: SDI stop response (p9566/p9366).
- 253: SDI delay time (p9565/p9365).
- 254: Setting the evaluation delay for actual value sensing after pulse enable (p9586/p9386).
- 255: Setting, behavior during pulse suppression (p9509/p9309).
- 256: Status image of monitoring functions SOS, SLS, SLP, test stop, SBR, SDI (result list 1 ext) (r9710).
- 257: Safety functions for motion monitoring functions without selection (p9512/p9312) different.
- 258: Fault tolerance, actual value sensing encoderless (p9585/p9385).
- 259: Scaling factor for safe position via PROFIsafe (p9574/p9374) or PROFIsafe telegram (p9611/p9811) different.
- 260: Modulo value including scaling (p9505/p9305 and p9574/p9374) for SP with 16 bit.
- 261: Scaling factor for acceleration for SBR different.
- 262: Scaling factor for the inverse value of the acceleration for SBR different.
- 263: Stop response for SLP2 (p9562[1]/p9362[1])
- 264: Position tolerance including scaling (p9542/p9342 and p9574/p9374) for SP with 16 bit.
- 265: Status image of all change functions (results list 1) (r9710).
- 266: The switchover speed to SOS differs (p9567/p9367).
- 267: The transition time to SOS after standstill differs (p9569/p9369).
- 268: SLP delay time differs (p9577/p9377).

## 4 Faults and alarms

### 4.2 List of faults and alarms

- 269: Factor to increase the position tolerance when switching over the gearbox stage (p9543/9343).
- 270: Screen form for SGE image: all functions, which are not supported/enabled for the actual parameterization (p9501/p9301, p9601/p9801 and p9506/p9306)..
- 271: Screen form for SGE image: Deselect all bits for the "Safe gearbox switchover" function.
- 272: activation of the increased position tolerance for the "Safe gearbox switchover" function different (p9568/p9368 or p9346/p9346 or "0").
- 273: speed limit value for flattening the ramp for SAM/SBR different.
- 274: SGA SCA, cams 1 to 15.
- 275: SGA SCA, cams 16 to 30.
- 276: Limit value for SLA1 (p9578/p9378).
- 277: Stop response for SLA1 (p9579/p9379).
- 278: Upper limit value for SLA1
- 279: Lower limit value for SLA1
- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:  
User agreement after the timer has expired different.  
The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003:  
Reference tolerance exceeded.  
When the user agreement is set, the difference between the new reference point that has been determined after the system boots (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.
- 1004:  
Plausibility error for user agreement.  
1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.  
2. The user agreement was set, although the axis has still not been referenced.
- 1005:  
- for safe motion monitoring functions without encoder: pulses already suppressed for test stop selection.  
- for safe motion monitoring functions with encoder: STO already active for test stop selection.
- 1011: Acceptance test status between the monitoring channels differ.
- 1012: Plausibility violation of the actual value from the encoder.
- 1014: fault when synchronizing the SGA for the "Safe cam" function
- 1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.
- 1020: Cyc. communication failure between the monit. channels.
- 1021: Cyc. communication failure between the monit. channel and Sensor Module.
- 1022: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 1.
- 1023: Error in the effectiveness test in the DRIVE-CLiQ encoder
- 1024: Sign-of-life error for HTL/TTL encoders.
- 1032: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 2.
- 1033: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 1.
- 1034: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 2.
- 1035: offset between POS1 and POS2 for DRIVE-CLiQ encoder on one of the monitoring channels has changed since the last commissioning.
- 1039: Overflow when calculating the position.
- 1041: Current absolute value too low (encoderless)
- 1042: Current/voltage plausibility error
- 1043: Too many acceleration phases
- 1044: Actual current values plausibility error.
- 5000 ... 5140:  
PROFIsafe message values.  
For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.

5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

An internal software error has occurred (only for internal Siemens troubleshooting).

5012: Error when initializing the PROFIsafe driver.

5013: The result of the initialization is different for the two controllers.

5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

5025: The result of the F parameterization is different for the two controllers.

5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.

5065: A communications error was identified when receiving the PROFIsafe telegram.

5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFISafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

7003: error when providing the data for the "Synchronous safe position via PROFIsafe" function.

7004: PROFIsafe clock cycle not correctly synchronized to the DP clock cycle.

**Remedy:**

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.

- if closed-loop control with edge modulation is parameterized (p1802[x] = 9): parameterize edge modulation for actual value sensing without encoder (p9507.5 = p9307.5 = 1).

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 15 ... 30 and 90 ... 229:

- the cam positions for function SCA in p9536/p9336, p9537/p9337 or the cam tolerance p9540/p9340 are not equal. Correct the values. Increase the cam tolerance p9540/p9340.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 274, 275:

- increase the cam tolerance p9540/p9340 and/or the position tolerance p9542/p9342.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the cross-checked parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.
  - correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).
- Note:
- For SINAMICS firmware version  $\geq 4.7$ , the KDV list is increased when setting  $p9567 > 0$ . For a non-compatible version of SINUMERIK this can lead to an error for the data cross-check (is indicated with message value  $\geq 237$ ). If necessary,  $p9567$  must be set = 0, or the firmware version of SINUMERIK upgraded.
- For message value = 1000:
- investigate the signal associated with the safety-relevant input (contact problems).
- For message value = 1001:
- carry out a POWER ON (switch-off/switch-on) for all components.
  - upgrade the Motor Module software.
  - upgrade the Control Unit software.
- For message value = 1002:
- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).
- For message value = 1003:
- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.
  - increase the tolerance for the actual value comparison when referencing ( $p9544$ ).
- Then check the actual values, perform a POWER ON and set the user agreement again.
- For message value = 1004:
- For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.
- For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.
- For message value = 1005:
- for safe motion monitoring functions without encoder: check the conditions for pulse enable.
  - for safe motion monitoring functions with encoder: check the conditions for STO deselection.
- Note:
- For a Power Module, the test stop should always be performed for pulse enable (independent of whether with encoder or without encoder).
- For message value = 1007:
- check the PLC for the correct operating state (run state, basic program).
- For message value = 1008:
- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.
- For message value = 1011:
- for diagnostics, refer to parameter ( $r9571$ ).
- For message value = 1012:
- upgrade the Sensor Module firmware to a more recent version.
  - for 1-encoder systems, the following applies: check the encoder parameters for equality ( $p9515/p9315$ ,  $p9519/p9319$ ,  $p9523/p9323$ ,  $p9524/p9324$ ,  $p9525/p9325$ ,  $p9529/p9329$ ).
  - for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from  $p04xx$ ,  $p9700$  must be set to 46 and  $p9701$  must be set to 172.
  - for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
  - check the electrical cabinet design and cable routing for EMC compliance
  - carry out a POWER ON (switch-off/switch-on) for all components or a warm restart ( $p0009 = 30$ ,  $p0976 = 2, 3$ ).
  - replace the hardware.
- For message value = 1014:
- check the encoder actual values. If required, increase the position tolerance ( $p9542$ ) and/or cam tolerance ( $p9540$ ).
- For message value = 1020, 1021, 1024:
- check the communication link.
  - if required, increase the monitoring cycle clock settings ( $p9500$ ,  $p9511$ ).
  - carry out a POWER ON (switch-off/switch-on) for all components or a warm restart ( $p0009 = 30$ ,  $p0976 = 2, 3$ ).
  - replace the hardware.

For message value = 1033, 1034:

- if required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

For message value = 1035, if one of the safety encoders was replaced:

- confirm the hardware replacement (p9700 = 29, p9701 = 236 or p9702 = 29).
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
- acknowledge fault (e.g. binector input p2103).

For message value = 1039:

- check the conversion factors such as spindle pitch or gearbox ratios.

For message value = 1041:

- check whether the motor has sufficient current (>r9785[0]).
- reduce the minimum current (p9588).
- for synchronous motors increase the absolute value of p9783.
- check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.
- increase the minimum current (p9588/p9388).

For message value = 1043:

- increase the voltage tolerance (p9589).
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

For message value = 5013, 5025:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F\_SIL, F\_CRC\_Length, F\_Par\_Version, F\_Source\_Add, F\_Dest\_add, F\_WD\_Time).

For message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

For message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5066:

#### SI Motion P1 (CU): Defect in F-IO processing

**Message value:** %1

**Message class:** Safety monitoring channel has identified an error (10)

**Drive object:** VECTOR\_G

**Component:** Control Unit (CU)

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C01711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, the safety message C01701 "SI Motion: STOP B initiated" is output after the parameterized timer has expired.

<b>C01770</b>	<b>SI Motion P1 (CU): Discrepancy error of the failsafe inputs/outputs</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Safety monitoring channel has identified an error (10)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Control Unit (CU)
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The failsafe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002/p10102 - or too many switching operations took place within a monitoring cycle p10002. Fault value (r0949, interpret bitwise binary): yyyyxxxx bin xxxx: Discrepancy error for failsafe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for failsafe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.
<b>Remedy:</b>	- check the wiring of the F-DI (contact problems). - if the wiring is correct, and there is no interrupted cable or similar, then a check must be made as to whether the switching frequency at FDI is too high, and should be reduced (switching pulses must have a longer time between them). After each edge at an FDI, as a minimum, the discrepancy time should elapse before switching again. Note: This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment). Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9507.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.

Sets the discrepancy time for fast switching operations at the F-DIs:

For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:

- the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down)
- the time between two switching pulses should be longer than the discrepancy time (if necessary, round up)
- the discrepancy time must be at least p9500. (it must always be rounded-down or rounded-up to an integer multiple of the SI sampling time p9500.)

If a debounce time has been parameterized (p10017>0), then the shortest possible discrepancy time is directly specified by the debounce time.

- the period of a cyclic switching pulse must be less than half of the discrepancy time-p10017 (if necessary, round down)
- the time between two switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up)
- the discrepancy time must be at least p9500 The debounce time must always be set less than the discrepancy time.

Example:

For an SI sampling time of 12 ms and a switching frequency of 110 ms (p10017 = 0), as a maximum, the discrepancy time can be set as follows:  $p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms}$  --> rounded off, p10002 <= 36 ms is obtained. As the discrepancy time is accepted rounded off to a integer SI sampling time, the result must be rounded off to an integer SI sampling time if the result is not a multiple integer of the SI sampling time. Basic constraint when setting the discrepancy time: Discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500). 7: -/0/0/-

9: -/0/1/-

11: -/0/1/-

13: -/1/1/-

Example:

Fault F01773 (P1) is signaled with fault value = 0001\_0127 and fault F30773 (P2) is signaled with fault value 0000\_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001\_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000\_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** Check the wiring of the failsafe digital output (F-DO) and restart the test stop.  
**Note:**  
- the fault is withdrawn if the test stop is successfully completed.  
- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

#### **A01774 SI Motion P1 (CU): Test stop for failsafe digital outputs required**

**Message value:** -  
**Message class:** Safety monitoring channel has identified an error (10)  
**Drive object:** VECTOR\_G  
**Component:** Control Unit (CU) **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The time set in p10003 for the forced checking procedure (test stop) for the failsafe digital outputs has been exceeded. A new forced checking procedure is required.  
After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.  
**Note:**  
- this message does not result in a safety stop response.  
- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.  
See also: p10003 (SI TM54F forced checking procedure timer)  
**Remedy:** Carry out the forced checking procedure for the digital outputs.  
The signal source to select the forced checking procedure is set via binector input p10007.

#### **A01780 SBT When selected, the brake is closed**

**Message value:** Following brakes are closed: %1 bin  
**Message class:** Safety monitoring channel has identified an error (10)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** When selecting the brake test or starting the brake test, not all of the brakes were open.  
Alarm value (r2124, interpret binary):  
Bit 0 = 1:  
The internal brake is closed.  
Bit 1 = 1:  
The external brake is closed (p10230.5, p10235.5, p10202).  
**Note:**  
The alarm is also issued, if a brake has not been configured in p10202.  
SBT: Safe Brake Test  
See also: p10202 (SI Motion SBT brake selection), p10230 (SI Motion SBT control word), p10235 (SI Safety Control Channel control word S\_STW3B)  
**Remedy:** Open all brakes and reselect the brake test (p10230.0, p10235.0).

**A01781 SBT brake opening time exceeded**

**Message value:** Fault cause: %1 bin  
**Message class:** Safety monitoring channel has identified an error (10)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The maximum time (11 s) to open the brake during the brake test was exceeded.  
Possible causes:  
- during the brake test the drive went into a fault condition, and therefore the brake was closed by the drive.  
- for an external brake, the feedback signal "Brake closed" was signaled too long (p10230.5, p10235).  
Alarm value (r2124, interpret binary):  
Bit 0 = 1:  
Internal brake was not able to be opened.  
Bit 1 = 1:  
External brake was not able to be opened.  
Note:  
SBT: Safe Brake Test  
**Remedy:** - carry out a safe acknowledgment.  
- restart the brake test (p10230.1, p10235.1).

**A01782 SBT brake test incorrect control**

**Message value:** Fault cause: %1 bin  
**Message class:** Safety monitoring channel has identified an error (10)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The brake test was canceled as a result of incorrect control.  
Alarm value (r2124, evaluate binary):  
Alarm value 0:  
The brake test was canceled as a result of a fault (brake opening time or brake closing time exceeded).  
Bit 0:  
The safe brake test was canceled by resetting the brake test selection.  
Bit 1:  
The safe brake test was canceled by resetting the brake test start.  
Bit 2:  
The brake, which was selected at the start of the brake test, has not been configured in p10202.  
When starting the brake test, as a result of the test top selection, brake 1 is not configured as internal brake.  
There is a brake test configuration error. In this case, alarm A01785 is also output.  
Note:  
SBT: Safe Brake Test  
See also: p10202 (SI Motion SBT brake selection)  
**Remedy:** - check parameterization of the brake test (p10202).  
- check as to whether alarm A01785 is present, and if so, evaluate.  
- carry out a safe acknowledgment.  
- if required, restart the brake test.

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Error when parameterizing the brake test.

In this configuration, the brake test cannot be started or cannot be started without error.

Alarm value (r2124, interpret decimal):

1:

No motion monitoring functions have been enabled.

2:

Two internal brakes were configured (p10202).

4:

No internal brakes were configured (p10202).

8:

The brake test is configured for an internal brake, however the safety brake control is not enabled (p9602/p9802).

(Note: from V5.1, SBT is permitted for the internal brake without SBC.)

16:

The safe brake test and Safety without encoder are simultaneously enabled (p9306/p9506). This is not permissible.

32:

The Safe Brake Test and vector U/f control is enabled. The safe brake test is not possible in this control mode.

<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Control Unit (CU)
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When parameterizing the modulo value for safe position via PROFIsafe (p9505) the position actual value can jump when the range that can be represented overflows. Range that can be represented: - 32-bit value: +/- 2048 revolutions - 16-bit value: +/- 2048 revolutions (depending on p9574)
<b>Remedy:</b>	Correct the parameter assignment. Set p9505 to $2^n$ revolutions - and to complete revolutions (i.e. a multiple of $360^\circ$ ). Note: This alarm can be hidden for the case that the possible position actual value jump can be tolerated for the particular application, or does not represent a problem; for example because the parameterized modulo range fits "almost as integer number" in the range of +/- 2048 revolutions that can be represented. To re-parameterize the alarm to "NO REPORT", it is not permissible that the alarm is present. As a consequence, the following sequence is required for the re-parameterization: - correct p9505 to " $2^n$ ". - re-parameterize the alarm using p2118 and p2119. - set p9505 back to the required value.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate:  
For communication with SINUMERIK, the following applies:  
- check any other PROFIBUS messages/signals present and remove their cause.  
- check that assignment of the axes on the higher-level control to the drives in the drive unit is correct.  
- check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it.  
For communication with TM54F, the following applies:  
- check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause.  
- check the setting of p10010. All the drive objects controlled by the TM54F must be listed.  
For communication with PROFIsafe F-Host, the following applies:  
- check any other PROFIsafe communication messages/signals present and evaluate them.  
- check the operating state of the F-Host.  
- check the communication connection to the F Host.  
- check the communication connection to the Motor Module/Hydraulic Module. It must be ensured that when the Control Unit powers up, the Motor Module/Hydraulic Module is connected and at the latest is also switched-on with the Control Unit. Otherwise, if the Motor Module/Hydraulic Module is subsequently inserted or switched on, a POWER ON must be performed at the Control Unit.

**A02007 Function generator: Drive not SERVO / VECTOR / DC\_CTRL**

**Message value:** %1  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** All objects  
**Component:** None **Propagation:** BICO  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The drive object specified for connection is not a SERVO / VECTOR or DC\_CTRL.  
See also: p4815 (Function generator drive number)  
**Remedy:** Use a SERVO / VECTOR / DC\_CTRL drive object with the corresponding number.  
Note:  
The alarm is reset as follows:  
- remove the cause of this alarm.  
- restart the function generator.

**A02008 Function generator: Drive specified a multiple number of times**

**Message value:** %1  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** All objects  
**Component:** None **Propagation:** BICO  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The drive object specified for connection is already specified.  
Alarm value (r2124, interpret decimal):  
Drive object number of the drive object that is specified a multiple number of times.  
**Remedy:** Specify a different drive object.  
Note:  
The alarm is reset as follows:  
- remove the cause of this alarm.  
- restart the function generator.

**A02099 Trace: Insufficient Control Unit memory**

**Message value:** -  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** All objects  
**Component:** None **Propagation:** BICO  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The memory space still available on the Control Unit is no longer sufficient for the trace function.  
**Remedy:** Reduce the memory required, e.g. as follows:  
- reduce the trace time.  
- increase the trace clock cycle.  
- reduce the number of signals to be traced.  
See also: r4708 (Trace memory space required), r4799 (Trace memory location free)

**A02100 Drive: Computing dead time current controller too short**

**Message value:** %1  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** All objects  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The value in p0118 produces a dead time of one clock cycle because it is prior to setpoint availability.  
Possible causes:  
- a parameter backup with a version higher than 4.3 was loaded to a version less than or equal to 4.3.  
- the system properties after replacing a component no longer match the parameter assignment.  
Alarm value (r2134, floating point):  
Minimum value for p0118 where dead time no longer occurs.  
**Remedy:**  
- set p0118 to zero.  
- set p0118 to a value greater than or equal to the alarm value (for p1810.11 = 1)  
- set p0117 (from the device) to an automatic setting (p0117 = 1).  
- check the firmware versions of the components involved.

## 4 Faults and alarms

### 4.2 List of faults and alarms

12 hex (18 dec):

A technology package was not able to be downloaded to a Control Unit because the warm restart necessary was not able to be performed.

Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a warm restart (p0009 = 30, p0976 = 2, 3).
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

For alarm value = 10 hex (16 dec):

Load a compatible DCB user library (compatible to the interface of the DCC standard library).

For alarm value = 12 hex (18 dec):

Carry out a POWER ON (switch-off/switch-on) for all components.

<b>Cause:</b>	The code numbers of the power units are not permissible. For parallel circuit configurations, only power units with identical power unit data may be used. Possible causes: - the code numbers of the power units do not match.		

For booksize drive units, the following additionally applies:  
 - a parallel connection is not possible for the power units being used.  
 - there are too many power units being used in the parallel connection.  
 Fault value (r0949, interpret decimal):  
 Parameter in which the inadmissible power unit code number was detected.

**Remedy:**

- Use power units with the same code number.  
 For booksize drive units, the following additionally applies:  
 - use power units which are permitted for a parallel connection.  
 - reduce the number of power units being used in the parallel connection.

<b>F06000</b>	<b>Infeed: Precharging monitoring time expired</b>		
<b>Message value:</b>	-		
<b>Message class:</b>	Infeed faulted (13)		
<b>Drive object:</b>	B_INF		
<b>Component:</b>	Power Module	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2 (OFF1)		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	After the line contactor closes the power unit does not signal the READY state within the monitoring time (p0857). The end of the DC link precharging was not able to be completed for one of the following reasons: 1) There is no line supply voltage connected. 2) The line contactor/line side switch has not been closed. 3) The line supply voltage is too low. 4) Line supply voltage incorrectly set (p0210). 5) The precharging resistors are overheated as there were too many precharging operations per time unit. 6) The precharging resistors are overheated as the DC link capacitance is too high. 7) The precharging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link. 8) The precharging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.		

- 9) The DC link has either a ground fault or a short-circuit.  
 10) The precharging circuit is possibly defective (only for chassis units).  
 See also: p0210 (Drive unit line supply voltage), p0857 (Power unit monitoring time)

**Remedy:**

In general:

- check the line supply voltage at the connecting terminals.
  - check the line supply voltage setting (p0210).
  - check the monitoring time and, if required, increase (p0857).
  - where relevant, observe additional power unit messages/signals (e.g. F30027).
  - the following applies to booksize units: Wait (approx. 8 min.) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.
- For 5):
- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).
- For 6):
- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Equipment Manual)
- For 7):
- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link
- For 8):
- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.
- For 9):
- check the DC link for ground faults or short circuits.
