<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The smoothed sum of the phase currents (i1 + i2 + i3) is impermissibly high. The total current has exceeded the parameterized threshold for the ground fault monitoring (p0287). Possible causes: - there is a ground fault that results in a high summation current (r0069.6). The DC component in the line currents can damage/destroy the power unit, reactor, filter or motor! - the current measurement in the power unit is defective. Fault value (r0949, floating point): Smoothed total of the phase currents.
<b>Remedy:</b>	- check the line supply for ground faults and remove any that are present. - check the set threshold for the ground fault monitoring (p0287). - if required, replace the power unit. See also: p0287 (Ground fault monitoring shutdown threshold)

**F07085****Drive: Open-loop/closed-loop control parameters changed**

**Message value:** Parameter: %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** B\_INF, VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** Open-loop/closed-loop control parameters have had to be changed.  
Possible causes:

1. As a result of other parameters, they have exceeded the dynamic limits.
2. They cannot be used due to the fact that the hardware detected not having certain features.
3. The value is estimated as the thermal time constant is missing.
4. Motor temperature model 1 is activated as thermal motor protection is missing.

Fault value (r0949, interpret decimal):

Changed parameter number.

340:

The motor and control parameters were automatically calculated (p0340 = 1), because the vector control was subsequently activated as configuration (r0108.2).

611:

The time constant for thermal motor model 1 was estimated.

612:

Thermal motor model 1 was activated (p0612.0 = 1).

**Remedy:**

Not necessary.

It is not necessary to change the parameters as they have already been correctly limited.

**F07086 Units changeover: Parameter limit violation due to reference value change**

**Message value:** Parameter: %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** B\_INF, ENC, VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation.

The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting.

Possible causes:

- the steady-state minimum limit/maximum limit or that defined in the application was violated.

Fault value (r0949, parameter):

Diagnostics parameter to display the parameters that were not able to be re-calculated.

**F07088 Units changeover: Parameter limit violation due to units changeover**

**Message value:** Parameter: %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** B\_INF, ENC, VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A changeover of units was initiated. This resulted in a violation of a parameter limit

Possible causes for the violation of a parameter limit:

- When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated.

- inaccuracies for the data type "FloatingPoint".

In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.

Fault value (r0949, interpret decimal):

Diagnostics parameter r9451 to display all parameters whose value had to be adapted.

<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	None
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds. When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.

See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration), p1280 (Vdc controller or Vdc monitoring configuration (U/f))

**Remedy:** If the controller is not to intervene:

- increase the ramp-down times.
- switch off the Vdc\_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).

If the ramp-down times are not to be changed:

- use a chopper or regenerative feedback unit.

- the motor is permanently in the regenerative mode as a result of a load that is driving the motor.

**Acknowledge:** IMMEDIATELY

**Cause:** The condition " $I_{act} = 0$  and  $U_{q\_set\_1}$  longer than 16 ms at its limit" is present and can be caused by the following:

- motor not connected or motor contactor open.
- motor data and motor configuration (star-delta) do not match.
- no DC link voltage present.
- power unit defective.
- the "flying restart" function is not activated.

**Remedy:**

<b>F07435 (N)</b>	<b>Drive: Setting the ramp-function generator for sensorless vector control</b>		
<b>Message value:</b>	Parameter: %1		
<b>Message class:</b>	Application/technological function faulted (17)		
<b>Drive object:</b>	VECTOR_G		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3)		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141) or bypassed (p1122). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen or was not able to be realized. The drive is switched-on with flying restart activated (p1200), and at the same time the ramp-function generator is bypassed (p1122).		
<b>Remedy:</b>	- deactivate the holding command for the ramp-function generator (p1141). - do not bypass the ramp-function generator (p1122). - suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6). Note: For sensorless vector control it is not practical to read in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.

<b>Drive object:</b>	VECTOR_G		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		
<b>Cause:</b>	The calculation of the jerk time $T_r = \max(p2572, p2573) / p2574$ resulted in an excessively high value so that the jerk time is internally limited to 1000 ms. Note: The alarm is also output if jerk limiting is not active.		
<b>Remedy:</b>	- increase the jerk limiting (p2574). - reduce maximum acceleration or maximum deceleration (p2572, p2573).		

**A07441**      **LR: Save the position offset of the absolute encoder adjustment**

**Message value:** -

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** VECTOR\_G

**Component:** None      **Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The status of the absolute encoder adjustment has changed.  
 In order to permanently save the determined position offset (p2525) and the determined number of the drive data set (p2733), they must be saved in a non-volatile fashion (p0971, p0977).  
 Possible causes:  
 - motor or encoder were replaced (applies to EQN and DQI).  
 - position-relevant parameters were changed.  
 - an encoder that was not adjusted was adjusted (save the project in a non-volatile fashion using "Copy RAM to ROM").  
 Note:  
 This message is not output when switching-on the axis after having first moved it in the switched-off state, as long as the parameterizable monitoring window was not exited.

**Remedy:** Readjust the encoder.

**F07442 (A)**      **LR: Multiturn does not match the modulo range**

**Message value:** -

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** VECTOR\_G

**Component:** None      **Propagation:** GLOBAL

**Reaction:** OFF1 (OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number.  
 This results in the adjustment being set back, as the position actual value cannot be reproduced after switch-off/switch-on.

**Remedy:** Make the ration between the multiturn resolution and the modulo range an integer number.  
 The ratio  $v$  is calculated as follows:  
 1. Motor encoder without position tracking  

$$v = (p0421 * p2506 * p0433 * p2505) / (p0432 * p2504 * p2576)$$
  
 2. Motor encoder with position tracking for the measuring gear  

$$v = (p0412 * p2506 * p2505) / (p2504 * p2576)$$
  
 3. Motor encoder with position tracking for the load gear  

$$v = (p2721 * p2506 * p0433) / (p0432 * p2576)$$
  
 4. Motor encoder with position tracking for the load and measuring gear  

$$v = (p2721 * p2506) / p2576$$
  
 5. Direct encoder without position tracking  

$$v = (p0421 * p2506 * p0433) / (p0432 * p2576)$$

<b>Cause:</b>	For a configured linear axis/no modulo axis, the currently effective motor encoder (encoder 1) has exceeded the maximum possible traversing range. **A07454 LR: Position actual value preprocessing does not have a valid encoder**

**Message value:** -  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** One of the following problems has occurred with the position actual value preprocessing:  
- an encoder is not assigned for the position actual value preprocessing (p2502 = 0).  
- an encoder is assigned, but no encoder data set (p0187 = 99 or p0188 = 99 or p0189 = 99).  
- an encoder an an encoder data set have been assigned, however, the encoder data set does not contain any encoder data (p0400 = 0) or invalid data (e.g. p0408 = 0).  
**Remedy:** Check the drive data sets, encoder data sets and encoder assignment.

**A07455 EPOS: Maximum velocity limited**

**Message value:** -  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The maximum velocity (p2571) is too high to correctly calculate the modulo correction.  
Within the sampling time for positioning (p0115[5]), with the maximum velocity, a maximum of the half modulo length must be moved through. p2571 was limited to this value.  
**Remedy:** - reduce the maximum velocity (p2571).  
- increase the sampling time for positioning (p0115[5]).

**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The actual setpoint velocity is greater than the parameterized maximum velocity (p2571) and is therefore limited.  
**Remedy:** - check the entered setpoint velocity.  
- reduce the velocity override (CI: p2646).  
- increase the maximum velocity (p2571).  
- check the signal source for the externally limited velocity (CI: p2594).

<b>Cause:</b>	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. Note: For a linear encoder, the following must be maintained: - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$ - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$
<b>Remedy:</b>	If required, reduce the traversing range or position resolution (p2506). Increase the fine resolution of absolute position actual value (p0419). Note for fault value = 3: If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow. For rotary encoders, the maximum possible absolute position (LU) is calculated as follows: 1. Motor encoder without position tracking $p2506 * p0433 * p2505 / (p0432 * p2504)$ $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$ for multiturn encoders 2. Motor encoder with position tracking for measuring gear $p2506 * p0412 * p2505 / p2504$ 3. Motor encoder with position tracking for load gear $p2506 * p2721 * p0433 / p0432$ 4. Motor encoder with position tracking for load and measuring gear $p2506 * p2721$ 5. Direct encoder without position tracking $p2506 * p0433 / p0432$ $p2506 * p0433 * p0421 / p0432$ for multiturn encoders 6. Direct encoder with position tracking for measuring gear $p2506 * p0412$

<b>Cause:</b>	An activated reference function (reference mark search or measuring probe evaluation) was interrupted. Possible causes: - an encoder fault has occurred (Gn_ZSW.15 = 1). - position actual value was set during an activated reference function. - simultaneously activate reference mark search and measuring probe evaluation (BI: p2508 and BI: p2509 = 1 signal). - activated reference function (reference mark search or measuring probe evaluation) was deactivated (BI: p2508 and BI: p2509 = 0 signal). - the input terminal for the measuring probe is not set.
<b>Remedy:</b>	- check the causes and resolve. - reset the control (BI: p2508 and BI: p2509 = 0 signal) and activate the requested function. - set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).

<b>Cause:</b>	In at least two drive data sets (DDS), the same motor data set (MDS) is assigned different encoder data sets (EDS) for the motor encoder. In various DDSs, it is not permissible for an MDS to have different motor encoders. <b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The system has identified that two motor data sets were incorrectly parameterized. Parameter r0313 (calculated from p0314, p0310, p0311), r0315 and p1982 may only have different values if the motor data sets are assigned different motors. p0827 is used to assign the motors and/contactors. It is not possible to toggle between motor data sets. Fault value (r0949, interpret hexadecimal): xxxxyyyy: xxxx: First DDS with assigned MDS, yyyy: Second DDS with assigned MDS
<b>Remedy:</b>	Correct the parameterization of the motor data sets.

<b>Cause:</b>	The motor cannot be changed over. The selected ratio of the measuring gear does not match the motor pole pair number.

**Remedy:** For fault cause = 1:  
- check the encoder parameterization (p0404).  
- use an encoder with track C/D, EnDat interface of Hall sensors.  
- use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) multiplied by the gear ratio (p0432/p0433) is less than the encoder pulse number (p0408) – or is an integer multiple of the encoder pulse number (p0408).  
- activate the pole position identification routine (p1982 = 1) for motor encoders without absolute position information. Then, using an encoder adjustment (p1990), the angular commutation offset should be determined.

<b>Drive object:</b>	B_INF, VECTOR_G
<b>Component:</b>	Power Module
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The power unit parameters cannot be read or no parameters are stored in the power unit. It is possible that the DRIVE-CLiQ cable between the Control Unit and power unit is interrupted or defective. Note: This fault also occurs if an incorrect topology was selected in the commissioning tool and this parameterization is then downloaded to the Control Unit. See also: r0200 (Power unit code number actual)
<b>Remedy:</b>	- carry out a POWER ON (switch-off/switch-on) for all components. - check the DRIVE-CLiQ cable between the Control Unit and power unit. - check the power unit and replace if necessary. - check the Control Unit, and if required replace it. - after correcting the topology, the parameters must be again downloaded using the commissioning tool.

**F07807 Drive: Short-circuit/ground fault detected**

**Message value:** %1  
**Message class:** Ground fault / inter-phase short-circuit detected (7)  
**Drive object:** VECTOR\_G  
**Component:** Motor **Propagation:** GLOBAL  
**Reaction:** OFF2 (NONE)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter.  
 Fault value (r0949, interpret decimal):  
 1: Short-circuit, phase UV.  
 2: Short-circuit, phase UW.  
 3: Short-circuit, phase VW.  
 4: Ground fault with overcurrent.  
 1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase V in per mille).  
 2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase U in per mille).  
**Note:**  
 Also when interchanging the line and motor cables is identified as a motor-side short circuit.  
 The ground fault test only functions when the motor is stationary.  
 Connecting to a motor that is either not de-energized or partially de-energized is possibly detected as ground fault.  
**Remedy:**  
 - check the motor-side converter connection for a phase-phase short-circuit.  
 - rule-out interchanged line and motor cables.  
 - check for a ground fault.  
 For a ground fault the following applies:  
 - do not enable the pulses when connecting to a rotating motor without the "Flying restart" function activated (p1200).  
 - increase the de-energization time (p0347).  
 - increase pulse suppression delay time (p1228) to ensure standstill.  
 - if required, deactivate the monitoring (p1901).

<b>F07815</b>	<b>Drive: Power unit has been changed</b>		
<b>Message value:</b>	Parameter: %1		
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)		
<b>Drive object:</b>	VECTOR_G		
<b>Component:</b>	Power Module	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum). Fault value (r0949, interpret decimal): Number of the incorrect parameter. See also: r0200 (Power unit code number actual), p0201 (Power unit code number)		
<b>Remedy:</b>	- Connect the original power unit and switch on the Control Unit again (POWER ON). - set p0201 to r0200 and exit commissioning with p0010 = 0. Note: If the power unit type was changed (see r0203) or the motor replaced, then the motor must be recommissioned (e.g. using p0010 = 1, p3900 = 3, p1900 = 1, 2). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ. If the new power unit is accepted, then if required, the current limit p0640 can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same). If the comparison stage in p9906 is set to 2, 3, then commissioning can be exited (p0010 = 0) and the fault acknowledged. This procedure is not recommended for different power unit types. See also: r0200 (Power unit code number actual)

<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)		
<b>Drive object:</b>	B_INF		
<b>Component:</b>	Power Module	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum). Fault value (r0949, interpret decimal): Number of the incorrect parameter. See also: r0200 (Power unit code number actual), p0201 (Power unit code number)		
<b>Remedy:</b>	Connect the original power unit and switch on the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0. For infeeds, the following applies: Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without recommissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.		

For inverters, the following applies:

If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).

If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.

<b>Remedy:</b>	For alarm value = 1: - in p0600 set an encoder with temperature sensor. For alarm value = 2: - interconnect p0603 with the temperature signal. <b>Cause:</b>	While identifying the rotor position of a separately excited synchronous motor based on voltage measurement, after the excitation time had elapsed, the flux was too low.

<b>A07899 (N)</b>	<b>Drive: Stall monitoring not possible</b>		
<b>Message value:</b>	Parameter: %1		
<b>Message class:</b>	Error in the parameterization / configuration / commissioning procedure (18)		
<b>Drive object:</b>	VECTOR_G		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	NONE		
<b>Acknowledge:</b>	NONE		
<b>Cause:</b>	Stall monitoring is not possible, because a change was made into the open-loop speed controlled mode before the wait time p2177 had expired.		

This situation can only occur, if the following conditions apply:

p1300 = 20  
p2177 > p1758  
p1750.2 = 0  
p1750.6 = 0

**Remedy:**

- Deactivate the changeover into open-loop speed controlled operation when operating at the torque limit (p1750.6 = 0).

Condition:

No slow reversing through the open-loop speed controlled operating range p1755 within the time p1758 when operating at the torque limit.

- shorten the stall detection wait time (p2177 < p1758).
- Activate closed-loop controlled operation from standstill and higher (p1750.2 = 1).

Condition:

There is no active load, for example, a hoisting gear

- Use an operating mode with encoder (p1300 = 21).

**F07900 (N, A) Drive: Motor blocked**

**Message value:** -

**Message class:** Application/technological function faulted (17)

**Drive object:** VECTOR\_G

**Component:** Motor **Propagation:** GLOBAL

**Reaction:** OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** Motor has been operating at the torque limit longer than the time specified in p2177 and below the speed threshold in p2175.  
This signal can also be initiated if the speed actual value is oscillating and the speed controller output repeatedly goes to its limit.  
If the simulation mode is enabled (p1272 = 1) and the closed-loop control with speed encoder activated (p1300 = 21), then the inhibit signal is generated if the encoder signal is not received from a motor that is driven with the torque setpoint of the closed-loop control.  
See also: p2175 (Motor blocked speed threshold), p2177 (Motor blocked delay time)

**Remedy:**

- check that the motor can freely move.
- check the effective torque limit (r1538, r1539).
- check the parameter, message "Motor blocked" and if required, correct (p2175, p2177).
- check the inversion of the actual value (p0410).
- check the motor encoder connection.
- check the encoder pulse number (p0408).
- after de-selecting the "Basic positioner" (EPOS) function mode, check the motoring (p1528) and regenerative (p1529) torque limit and modify again.
- in the simulation mode and operation with speed encoder, the power unit to which the motor is connected must be switched on and must be supplied with the torque setpoint of the simulated closed-loop control. Otherwise, change over to encoderless control (see p1300).
- check the direction of rotation enable signals for a flying restart of the motor (p1110, p1111).
- for U/f control: check the current limits and acceleration times (p0640, p1120).

<b>F07901</b>	<b>Drive: Motor overspeed</b>
<b>Message value:</b>	-
<b>Message class:</b>	Application/technological function faulted (17)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Motor
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2 (IASC/DCBRK)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The maximum permissible speed was either positively or negatively exceeded. The maximum permissible positive speed is formed as follows: Minimum (p1082, CI: p1085) + p2162 The maximum permissible negative speed is formed as follows: Maximum (-p1082, CI: 1088) - p2162
<b>Remedy:</b>	The following applies for a positive direction of rotation: - check r1084 and if required, correct p1082, CI:p1085 and p2162. The following applies for a negative direction of rotation: - check r1087 and if required, correct p1082, CI:p1088 and p2162. Activate precontrol of the speed limiting controller (p1401.7 = 1). Increase the hysteresis for the overspeed signal p2162. This upper limit is dependent upon the maximum motor speed p0322 and the maximum speed p1082 of the setpoint channel.

<b>F07902 (N, A)</b>	<b>Drive: Motor stalled</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Application/technological function faulted (17)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Motor
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The system has identified that the motor has stalled for a time longer than is set in p2178. Fault value (r0949, interpret decimal): 1: Stall detection using r1408.11 (p1744, p0492). 2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 ... r0084). 3: Stall detection using r0056.11 (only for separately excited synchronous motors). See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)
<b>Remedy:</b>	It should always be carefully ensured that the motor data identification (p1910) as well as the rotating measurement (p1960) were carried out (also refer to r3925). For synchronous motors with encoder, the encoder must have been adjusted (p1990). For closed-loop speed and torque control with speed encoder, the following applies: - check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft). - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover. If there is no fault, then the fault tolerance (p1744 or p0492) can be increased. For resolvers with a high signal ripple, for example p0492 should be increased and the speed signal smoothed (p1441, p1442). If the stalled motor should take place in the range of the monitor model and for speeds of less than 30 % of the rated motor speed, then a change can be made directly from the current model into the flux impression (p1401.5 = 1). We therefore recommend that the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 x p0311; p1753 = 5 %). - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover. For closed-loop speed and torque control without speed encoder, the following applies: - check whether the drive stalls solely due to the load in controlled mode (r1750.0) or when the speed setpoint is still zero. If so, increase the current setpoint via p1610 or set p1750.2 = 1 (sensorless vector control to standstill for passive loads). - if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again or quick magnetizing selected (p1401). - check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again. - if there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.

The following generally apply for closed-loop and torque control:

- check whether the motor cables are disconnected.
- check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.
- if the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553.

For separately excited synchronous motors (closed-loop control with speed encoder), the following applies:

- check the speed signal (interrupted cable, polarity, pulse number).
- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).
- check the excitation equipment and the interface to the closed-loop control.
- encoder the highest possible dynamic response of the closed-loop excitation current control.
- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.
- do not exceed the maximum speed (p2162).

If there is no fault, then the delay time can be increased (p2178).

### A07903 Drive: Motor speed deviation

**Message value:** -  
**Message class:** Application/technological function faulted (17)  
**Drive object:** VECTOR\_G  
**Component:** Motor **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The absolute value of the speed difference from the two setpoints (p2151, p2154) and the speed actual value (r2169) exceeds the tolerance threshold (p2163) longer than tolerated (p2164, p2166).  
The alarm is only enabled for p2149.0 = 1.  
Possible causes could be:  
- the load torque is greater than the torque setpoint.  
- when accelerating, the torque/current/power limit is reached. If the limits are not sufficient, then it is possible that the drive has been dimensioned too small.  
- for closed-loop torque control, the speed setpoint does not track the speed actual value.  
- for active Vdc controller.  
For U/f control, the overload condition is detected as the I<sub>max</sub> controller is active.  
See also: p2149 (Monitoring configuration)  
**Remedy:**  
- increase p2163 and/or p2166.  
- increase the torque/current/power limits.  
- for closed-loop torque control: The speed setpoint should track the speed actual value.  
- deactivate alarm with p2149.0 = 0.

**Cause:** When closing, the contactor feedback signal (p1235) did not issue the signal "Closed" (r1239.1 = 1) within the monitoring time (p1236).  
**Remedy:**  
- check that the contactor feedback signal is correctly connected (p1235).  
- check the logic of the contactor feedback signal (r1239.1 = 1: "Closed", r1239.1 = 0: "Open").  
- increase the monitoring time (p1236).

<b>Cause:</b>	Invalid parameter values were entered for the envelope characteristic of the load monitoring. <b>Cause:</b>	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in p1233. <b>Cause:</b>	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).
<b>Remedy:</b>	If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V < DC link voltage < 800 V), the armature short-circuit is withdrawn after 3 minutes.

<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The Control Unit has detected a brake control error. - motor cable is not shielded correctly. - defect in the brake control circuit of the Motor Module. Fault value (r0949, interpret decimal): 10, 11: Fault in "open holding brake" operation. - no brake connected or wire breakage (check whether brake opens for p1278 = 1). - ground fault in brake cable. - S120M: brake opened via terminal X4.1 for mounting purposes (this is only permissible when the power supply voltage is switched off). 20: Fault in "brake open" state. - short-circuit in brake winding. 30, 31: Fault in "close holding brake" operation. - no brake connected or wire breakage (check whether brake opens for p1278 = 1). - short-circuit in brake winding. 40: Fault in "brake closed" state. 50: Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control diagnostics). 80: When using the Safe Brake Adapter (SBA), a fault has occurred in the brake control of the Control Unit. See also: p1278 (Brake control diagnostics evaluation)
<b>Remedy:</b>	- check the motor holding brake connection. - for a parallel connection, check the setting of the power unit data set to control the holding brake (p7015). - check the function of the motor holding brake. - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).

- replace the Motor Module involved.

Operation with Safe Brake Module:

- check the Safe Brake Module connection.

- replace the Safe Brake Module.

Operation with Safe Brake Adapter (SBA):

- check the SBA connection and if required, replace the SBA.

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A connected motor holding brake has been detected with an S120 Combi. However, this brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly).

Fault value (r0949, interpret decimal):

0: No motor holding brake is assigned (p1215 = 0 or 3 on all S120 Combi feed drives).

1: More than one motor holding brake has been assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive)

- or there is more than one DRIVE-CLiQ motor with motor holding brake.

## 4 Faults and alarms

### 4.2 List of faults and alarms

2: Brake was accidentally assigned to the spindle (p1215 = 1); this is not permitted for this software release.  
3: An attempt was made to enable the function "Safe Brake Control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted for this software release.

**Remedy:** Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2).

The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive.

**Message value:** %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** An incorrect motor holding brake configuration was detected.

Fault value (r0949, interpret decimal):

0:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time).

For a chassis unit with Safe Brake Adapter (SBA), the interconnection p9621 = r9872.3 was established (only when commissioning for the first time).

For a parallel connection, the power unit was set in p7015, to which the motor holding brake is connected (only when commissioning for the first time).

1:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was left at "No motor holding brake available" (p1215 = 0).

11:

The identification had detected more than one motor holding brake for a parallel connection.

12:

For the parallel connection, in p0121 there is no valid component number for the power unit data set that is set in p7015.

13:

With the "Safe Brake Control" (SBC) function activated, an attempt was made to change the value in p7015.

14:

For a parallel connection, the power units set in p7015 cannot be addressed.

**Remedy:** For fault value = 0:

- no remedy required.

For fault value = 1:

- if required change the motor holding brake configuration (p1215 = 1, 2).

- if this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged.

For fault value = 11:

For a parallel connection, only connect one motor holding brake.

For fault value = 12:

Check the setting of the power unit data set for a parallel connection (p7015).

For fault value = 13:

Before changing p7015, deactivate the "Safe Brake Control" function (SBC) (p9602).

For fault value = 14:

Check whether the power unit supports the brake control for a parallel connection (r9771.14).

Check whether there is a DRIVE-CLiQ communication error between the Control Unit and the power unit involved and, if required, carry out a diagnostics routine for the faults identified.

<b>Cause:</b>	The friction characteristic is incorrect. Alarm value (r2124, interpret decimal): 1: Incorrect parameter format. 1538: The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 1539: The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value. 3820 ... 3829: Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition: $0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$ or $p1082$ , if $p0322 = 0$ Therefore the output of the friction characteristic (r3841) is set to zero. 3830 ... 3839: Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition: $0 \leq p3830, p3831 \dots p3839 \leq p0333$ Therefore the output of the friction characteristic (r3841) is set to zero. See also: r3840 (Friction characteristic status word)		
<b>Remedy:</b>	Fulfill the conditions for the friction characteristic. For alarm value = 1538: Check the upper effective torque limit (e.g. in the field weakening range). **Drive object:** VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred during the pole position identification routine.

Fault value (r0949, interpret decimal):

1: Current controller limited

2: Motor shaft locked.

4: Encoder speed signal not plausible.

10: Stage 1: The ratio between the measured current and zero current is too low.

- 11: Stage 2: The ratio between the measured current and zero current is too low.
- 12: Stage 1: The maximum current was exceeded.
- 13: Stage 2: The maximum current was exceeded.
- 14: Current difference to determine the +d axis too low.
- 15: Second harmonic too low.
- 16: Drive converter too small for the measuring technique.
- 17: Abort due to pulse inhibit.
- 18: First harmonic too low.
- 20: Pole position identification requested with the motor shaft rotating and activated "flying restart" function.

**Remedy:**

For fault value = 1:

- check whether the motor is correctly connected.
- check whether motor data have been correctly entered.
- replace the Motor Module involved.

For fault value = 2:

- open the motor holding brake (p1215 = 2) and bring the motor into a no-load condition.

For fault value = 4:

- check whether the encoder pulse number (p0408) and gearbox ratio (p0432, p0433) are correct.
- check whether the motor pole pair number is correct (p0314).

For fault value = 10:

- when selecting p1980 = 4: increase the value for p0325.
- when selecting p1980 = 1: increase the value for p0329.
- check whether the motor is correctly connected.
- replace the Motor Module involved.

For fault value = 11:

- increase the value for p0329.
- check whether the motor is correctly connected.
- replace the Motor Module involved.

For fault value = 12:

- when selecting p1980 = 4: reduce the value for p0325.
- when selecting p1980 = 1: reduce the value for p0329 (minimum, p0305).
- if p0329 = p0305: then reduce p0356, p0357.
- check whether motor data have been correctly entered.

For fault value = 13:

- reduce the value for p0329.
- check whether motor data have been correctly entered.

For fault value = 14:

- increase the value for p0329.
- motor not sufficiently anisotropic, change the technique (p1980 = 1, 10).

For fault value = 15:

- increase the value for p0325.
- motor not sufficiently anisotropic, change the technique (p1980 = 1, 10).

For fault value = 16:

- deactivate the technique (p1982).

For fault value = 17:

- the same as fault value 12 – or repeat the technique.

For fault value = 18:

- increase the value for p0329.
- saturation not sufficient, change the technique (p1980 = 10).

For fault value = 20:

- before carrying out a pole position identification routine ensure that the motor shaft is absolutely stationary (zero speed).

<b>Drive object:</b>	VECTOR_G		
<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF1 (NONE, OFF2)		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	A fault has occurred during the encoder test. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The speed setpoint was not able to be approached as the minimum limiting is active. 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 4: The speed setpoint was not able to be approached as the maximum limiting is active. 5: The encoder does not supply a signal. 6: Incorrect polarity. 7: Incorrect pulse number. 8: Noise in the encoder signal or speed controller unstable. 9: Voltage Sensing Module (VSM) incorrectly connected.		
<b>Remedy:</b>	For fault value = 1: - check the motor parameters. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 2: - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080). <b>Reaction:</b>	OFF1 (NONE, OFF2)		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	A fault has occurred while determining the saturation characteristic. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The rotor flux did not reach a steady-state condition.		

- 3: The adaptation circuit did not reach a steady-state condition.
- 4: The adaptation circuit was not enabled.
- 5: Field weakening active.
- 6: The speed setpoint was not able to be approached as the minimum limiting is active.
- 7: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
- 8: The speed setpoint was not able to be approached as the maximum limiting is active.
- 9: Several values of the determined saturation characteristic are not plausible.
- 10: Saturation characteristic could not be sensibly determined because load torque too high.

**Remedy:**

For fault value = 1:  
 - the total drive moment of inertia is far higher than that of the motor (p0341, p0342).  
 De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 1 ... 2:  
 - increase the measuring speed (p1961) and repeat the measurement.

For fault value = 1 ... 4:  
 - check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.  
 - check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.  
 - carry out a motor data identification routine (p1910).  
 - if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 5:  
 - the speed setpoint (p1961) is too high. Reduce the speed.

For fault value = 6:

10: After the setpoint step, the speed either changed too little or in the incorrect direction.

11: The identified moment of inertia is not plausible. The measured moment of inertia is less than the 0.05x or greater than 500x the preset moment of inertia of the motor p0341.

**Remedy:**

For fault value = 1:

For fault value = 8:

- the total drive moment of inertia is far higher than that of the motor (refer to p0341, p0342). De-select rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 9:

- check the moment of inertia (p0341, p0342). After the change, re-calculate (p0340 = 3 or 4).

For fault value = 10:

- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.

For fault value = 11:

- reduce the moment of inertia of the motor p0341 (e.g. factor of 0.2) or increase (e.g. factor of 5) and repeat the measurement.

Note:

The moment of inertia identification routine can be disabled using p1959.2.

<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	An error has occurred while measuring the dynamic leakage inductance. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The speed setpoint was not able to be approached as the minimum limiting is active. 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 4: The speed setpoint was not able to be approached as the maximum limiting is active. 5: The 100% flux setpoint was not reached.		

- 6: No Lq measurement possible because field weakening is active.
- 7: Speed actual value exceeds the maximum speed p1082 or 75% of the rated motor speed.
- 8: Speed actual value is below 2 % of the rated motor speed.

**Remedy:**

- For fault value = 1:
  - check the motor parameters.
  - carry out a motor data identification routine (p1910).
  - if required, reduce the dynamic factor (p1967 < 25 %).
- For fault value = 2:
  - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).
- For fault value = 3:
  - adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).
- For fault value = 4:
  - adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).
- For fault value = 5:
  - flux setpoint p1570 = 100 % and current setpoint p1610 = 0 % kept during the Lq measurement.
- For fault value = 6:
  - reduce the regenerative load so that the drive does not reach field weakening when accelerating.
  - reduce p1965 so that the q leakage inductance is recorded at lower speeds.
- For fault value = 7:
  - increase p1082, if this is technically permissible.
  - reduce p1965 so that the q leakage inductance is recorded at lower speeds.
- For fault value = 8:
  - reduce the load when motoring so that the drive is not braked.
  - increase p1965 so that the measurement may be taken at higher speeds.

**Note:**

The measurement of the q leakage inductance can be disabled using p1959.5. If only p1959.5 is set, then only this measurement is carried out if p1960 is set to 1, 2 and the drive is switched on.

## 4 Faults and alarms

### 4.2 List of faults and alarms

- 15: Pulse inhibit occurred during motor data identification.
- 16: During the Rs measurement an error occurred when activating one or several power modules connected in parallel.
- 17: After the Rs measurement an error occurred when activating one or several power modules connected in parallel.
- 20: Identified threshold voltage of the semiconductor devices lies outside the expected range 0 ... 10 V.
- 30: Current controller in voltage limiting.
- 40: At least one identification contains errors. The identified parameters are not saved to prevent inconsistencies.
- 50: The selected sampling time is too low for the motor identification (p0115[0]).
- 70: Identification of the circle center point canceled (reluctance motor).

Note:

Percentage values are referred to the rated motor impedance:

$$Z_n = V_{\text{mot,nom}} / \sqrt{3} / I_{\text{mot,nom}}$$

#### Remedy:

For fault value = 1 ... 40:

- check whether motor data have been correctly entered in p0300, p0304 ... p0311.
- is there an appropriate relationship between the motor power rating and that of the Motor Module? The ratio of the Motor Module to the rated motor current should not be less than 0.5 and not be greater than 4.
- check connection type (star-delta).

For fault value = 11 in addition:

- deactivate oscillation monitoring (p1909.7 = 1).

For fault value = 2:

- for parallel circuits, check the motor winding system in p7003. If, for power units connected in parallel, a motor is specified with a single-winding system (p7003 = 0), although a multi-winding system is being used, then a large proportion of the stator resistance is interpreted as feeder cable resistance and entered in p0352.

For fault value = 4, 7:

- check whether inductances are correctly set in p0233 and p0353.
- check whether motor has been correctly connected (star-delta).
- set p1909.0 = 1.

For fault value = 12:

- check the power cable connections.
- check the motor.
- check the CT.

For fault value = 50:

- perform a motor data identification with a higher sampling time, and after this, change to the required higher sampling time (p0115[0]).

<b>Cause:</b>	A consistency error was detected when activating the configuration (p8945) for the Communication Board Ethernet 20/25 (CBE20/CBE25). Alarm value (r2124, interpret decimal): 0: general consistency error 1: error in the IP configuration (IP address, subnet mask or standard gateway). 2: Error in the station names. 3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists. 4: a cyclic PROFINET connection is not possible as DHCP is activated.
	Note: For all alarm values, the following applies: currently set configuration has not been activated. DHCP: Dynamic Host Configuration Protocol See also: p8940 (CBE2x Name of Station), p8941 (CBE2x IP address), p8942 (CBE2x Default Gateway), p8943 (CBE2x Subnet Mask), p8944 (CBE2x DHCP Mode)
<b>Remedy:</b>	- check the required interface configuration (p8940 and following), correct if necessary, and activate (p8945). or - reinitialize the station using the "Edit Ethernet node" screen form (e.g. with STARTER commissioning tool). See also: p8945 (CBE2x activate interface configuration)

<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A CAN communications error has occurred. Fault value (r0949, interpret decimal): 1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller. - bus cable short circuit. - incorrect baud rate. - incorrect bit timing.

2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]).

- bus cable interrupted.
- bus cable not connected.
- incorrect baud rate.
- incorrect bit timing.
- master fault.

Note:

The fault response can be set as required using p8641.

See also: p8604 (CAN life guarding), p8641 (CAN Abort Connection Option Code)

**Remedy:**

- check the bus cable
- check the baud rate (p8622).
- check the bit timing (p8623).
- check the master.

The CAN controller must be manually restarted with p8608 = 1 after the cause of the fault has been resolved!

#### F30001

#### Power unit: Overcurrent

**Message value:** Fault cause: %1 bin

**Message class:** Power electronics faulted (5)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Power Module

**Propagation:** LOCAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an overcurrent condition.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- U/f operation: Up ramp set too low.
- U/f operation: Rated motor current is significantly greater than that of the Motor Module.
- infeed: High discharge and post-charging currents for line voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at switch-on as there is no commutating reactor.
- power cables are not correctly connected.
- the power cables exceed the maximum permissible length.
- power unit defective.
- line phase interrupted.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (switched off) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

Bit 3: Overcurrent in the DC link.

Note:

Fault value = 0 means that the phase with overcurrent is not recognized (e.g. for blocksize device).

- Remedy:**
- check the motor data - if required, carry out commissioning.
  - check the motor circuit configuration (star/delta).
  - U/f operation: Increase up ramp.
  - U/f operation: Check the assignment of the rated currents of the motor and Motor Module.
  - infeed: Check the line supply quality.
  - infeed: Reduce the motor load.
  - infeed: Check the correct connection of the line filter and the line commutating reactor.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.
  - replace power unit.
  - check the line supply phases.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
  - check the setting of the closed-loop circulating current control (p7036, p7037).

**F30003 Power unit: DC link voltage undervoltage**

**Message value:** -

**Message class:** Infeed faulted (13)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Power Module **Propagation:** LOCAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line supply infeed failed or interrupted.
- line phase interrupted.

**Note:**  
The monitoring threshold for undervoltage in the DC link is indicated in r0296.

**Remedy:**

- check the line supply voltage
- check the line supply infeed and observe the fault messages relating to it (if there are any)
- check the line supply phases.
- check the line supply voltage setting (p0210).
- booksize units: check the setting of p0278.

**Note:**  
The ready signal for the infeed (r0863) must be interconnected to the associated drive inputs (p0864).

**Message value:** %1

**Message class:** Power electronics faulted (5)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Power Module **Propagation:** LOCAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

**Fault value (r0949, interpret decimal):**  
Temperature [0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

**Notice:**  
This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

- the permissible rated power unit current was exceeded for an inadmissibly long time.  
- the permissible load duty cycle was not maintained.  
Fault value (r0949, interpret decimal):  
I2t [100 % = 16384].  
**Remedy:**  
- reduce the continuous load.  
- adapt the load duty cycle.  
- check the motor and power unit rated currents.  
- increase p0294

**F30006 Power unit: Thyristor Control Board**

**Message value:** -  
**Message class:** Power electronics faulted (5)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The Thyristor Control Board (TCB) of the Basic Line Module signals a fault.  
- there is no line supply voltage.  
- the line contactor is not closed.  
- the line supply voltage is too low.  
- line supply frequency outside the permissible range (45 ... 66 Hz).  
- there is a DC link short-circuit.  
- there is a DC link short-circuit (during the precharging phase).  
- the motor either has a short-circuit or insulation fault (from an inverter connected to the DC link).  
- voltage supply for the Thyristor Control Board outside the nominal range (5 ... 18 V) and line voltage >30 V.  
- there is an internal fault in the Thyristor Control Board.

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Remedy:** The faults must be saved in the Thyristor Control Board and must be acknowledged. To do this, the supply voltage of the Thyristor Control Board must be switched out for at least 10 s!

- check the line supply voltage
- check or energize the line contactor.
- check the monitoring time and, if required, increase (p0857).
- if required, observe additional power unit messages/signals.
- check the DC link regarding short-circuit or ground fault.
- check the motor regarding short-circuit or ground fault.
- evaluate diagnostic LEDs for the Thyristor Control Board.

#### **F30008 Power unit: Sign-of-life error cyclic data**

**Message value:** -  
**Message class:** Internal (DRIVE-CLiQ) communication error (12)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** Control Unit (CU) **Propagation:** LOCAL  
**Reaction:** Vector: NONE (OFF1, OFF2, OFF3)  
Infeed: NONE (OFF1, OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** The Control Unit has not punctually updated the cyclic setpoint telegram to the power unit. The number of consecutive tolerated sign of life errors has exceeded the fault threshold (p7789) set in the power unit.  
**Remedy:**

- for projects with the VECTOR drive object, check whether p0117 = 6 has been set on the Control Unit.
- increase the fault threshold (p7789).
- check the Motor Module, and if required replace.

**Drive object:** B\_INF, VECTOR\_G  
**Component:** Control Unit (CU) **Propagation:** LOCAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A DRIVE-CLiQ communication error has occurred between the Control Unit and the power unit involved. The cyclic setpoint telegrams of the Control Unit were not received on time by the power unit for at least one clock cycle.  
**Remedy:** Check the Motor Module and if required, replace.

#### **F30011 Power unit: Line phase failure in main circuit**

**Message value:** %1  
**Message class:** Network fault (2)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2 (OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** At the power unit, the DC link voltage ripple has exceeded the permissible limit value.  
Possible causes:

- a line phase has failed.
- the 3 line phases are inadmissibly asymmetrical.
- the capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.
- the fuse of a phase of a main circuit has ruptured.
- a motor phase has failed.
- for power units operated on a single phase, the permissible active power was exceeded.

Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

- Remedy:**
- check the main circuit fuses.
  - check whether a single-phase load is distorting the line voltages.
  - Detune the resonant frequency with the line inductance by using an upstream line reactor.
  - Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.
  - check the motor feeder cables.

<b>F30017</b>	<b>Power unit: Hardware current limit has responded too often</b>		
<b>Message value:</b>	Fault cause: %1 bin		
<b>Message class:</b>	Power electronics faulted (5)		
<b>Drive object:</b>	B_INF, VECTOR_G		
<b>Component:</b>	Power Module	<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	OFF2		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit. For infeed units, the following applies: <ul style="list-style-type: none"><li>- closed-loop control is incorrectly parameterized.</li><li>- load on the infeed is too high.</li><li>- Voltage Sensing Module incorrectly connected.</li><li>- line reactor missing or the incorrect type.</li><li>- power unit defective.</li></ul>		

The following applies to Motor Modules:

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):

Bit 3: phase U

Bit 4: phase V

Bit 5: phase W

Additional bits:

Only for internal Siemens troubleshooting.

Note:

Fault value = 0 means that the phase with current limiting is not recognized (e.g. for blocksize device).

**Remedy:**

For infeed units, the following applies:

- check the controller settings and reset and identify the controller if necessary (p0340 = 2, p3410 = 5)
- reduce the load and increase the DC link capacitance or use a higher-rating infeed if necessary
- check the connection of the optional Voltage Sensing Module
- check the connection and technical data of the line reactor
- check the power cables for short-circuit or ground fault.
- replace power unit.

The following applies to Motor Modules:

- check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
- check the motor circuit configuration (star-delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

**F30020**

**Power unit: Configuration not supported**

**Message value:**

fault cause: %1, additional information: %2

**Message class:**

**Drive object:**

B\_INF, VECTOR\_G

**Component:**

Power Module

**Propagation:**

LOCAL

**Reaction:**

OFF2

**Acknowledge:**

IMMEDIATELY

**Cause:**

A configuration is requested that is not supported by the power unit.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: xxxx = fault cause, yyyy = additional information (internal Siemens)

xxxx = 0: Autonomous operation is requested but is not supported.

xxxx = 1: The requested DRIVE-CLiQ timing is not permissible.

xxxx = 2: A PM260 has been detected with PS-ASIC version 2. This combination is not supported.

xxxx = 3: Initialization was not able to be successfully completed. It is possible that the Control Unit was withdrawn from the Power Module before or during power up.

xxxx = 4: The combination of power unit and Control Unit or Control Unit Adapter is not supported.

xxxx = 5: The higher current controller dynamic performance is not supported.

**Remedy:**

For fault cause = 0:

If required, deactivate an active internal voltage protection (p1231).

For fault cause = 1:

Update the Control Unit firmware or change the DRIVE-CLiQ topology.

For fault cause = 2:

Replace the power unit with a PM260 with PS-ASIC version 3 (or higher).

For fault cause = 3, 4:

Insert a Control Unit or Control Unit Adapter (CUAxx) on an appropriate Power Module and perform a POWER ON for the Control Unit or the Control Unit Adapter.

For fault cause = 5:

- use a booksize format power unit.
- for a Double Motor Module operate the two drive controls with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.
- if required, de-select the higher current controller dynamic performance (p1810.11 = 0). After deselecting the computing dead time, recalculate the controller gains (p0340 = 4). If required, optimize the speed controller.

**Message class:** Infeed faulted (13)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Power Module

**Propagation:** LOCAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit DC link was not able to be precharged within the expected time.

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The precharging resistors are overheated as there were too many precharging operations per time unit.
- 6) The precharging resistors are overheated as the DC link capacitance is too high.
- 7) The precharging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The precharging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The precharging circuit is possibly defective (only for chassis units).
- 11) Infeed is defective and/or fuse has ruptured in the Motor Module (only Booksize units).

#### Remedy:

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).

For booksize drive units, the following applies:

- wait (approx. 8 minutes) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

For 5):

- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).

For 6):

- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Equipment Manual)

For 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

For 8):

- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.

For 9):

- check the DC link for ground faults or short circuits.

For 11):

- check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).

If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

#### A30030

#### Power unit: Internal overtemperature alarm

**Message value:** %1

**Message class:** Power electronics faulted (5)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Power Module

**Propagation:** LOCAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature inside the drive converter has exceeded the permissible temperature limit.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** - possibly use an additional fan.

- check whether the ambient temperature is in the permissible range.

Notice:

This alarm is automatically withdrawn once the permissible temperature limit value has been fallen below minus 5 K.

#### A30031

#### Power unit: Hardware current limiting in phase U

**Message value:** -

**Message class:** Power electronics faulted (5)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Power Module

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Hardware current limit for phase U responded. The pulsing in this phase is inhibited for one pulse period.

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.

- motor load too high
- power unit defective.

**Note:**

Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds.

**Remedy:**

- check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
- check the motor circuit configuration (star/delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.

Bit 1 = 1: fan inside the device

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Note:**

- for firmware version < 5.1 of the power unit, the alarm value is always 0. The alarm then refers to the heat sink fan.
- for r0193.13 = 1, fault F30058 is output instead of this alarm for heat sink fans, if the pulses are inhibited or the fault occurs within 10 s after the fan runs up when the pulses are enabled.
- for r0193.13 = 1, fault F30059 is output instead of this alarm for fans inside the unit, if the air intake temperature (r0037[3]) has exceeded a specific threshold.

**Remedy:**

- check the fan involved.
- if required, replace the fan.
- check the fan power supply and if required switch on (only for r0193.13 = 1 and heat sink fan)

**Note:**

If the alarm has been withdrawn, this does not necessarily mean that the cause of the fault has been resolved. It is also possible that the software switched off the fan, and therefore can no longer evaluate the feedback signal.

<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed. Fault F30011 is output if the alarm is present and at the latest after 5 minutes. The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active. Alarm value (r2124, interpret decimal): Only for internal Siemens troubleshooting.
<b>Remedy:</b>	- check the line phase connection. - check the motor feeder cable connections. If there is no phase failure of the line or motor, then line asymmetry is involved. - reduce the power in order to avoid fault F30011.

<b>Message class:</b>	External measured value / signal state outside the permissible range (16)
<b>Drive object:</b>	B_INF, VECTOR_G
<b>Component:</b>	Power Module
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF2 (NONE, OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The feedback signal from the heat sink fan signals a fault. - fan defective. - fan blocked. - feedback signal inaccurate. - fan power supply interrupted (only for r0193.13 = 1)
<b>Remedy:</b>	- check the heat sink fan and replace if necessary. - check the fan power supply and if required switch on (only for r0193.13 = 1) - if you are using an external fan with feedback signal, check its wiring (X12.2 or X13.2).
	<b>Note:</b> - when using an external fan without feedback signal, check the wiring of the feedback signal terminal at the power unit with respect to ground and if necessary, setup (X12.1/2 or X13.1/2). - if the fault can be acknowledged, this does not necessarily mean that the cause of the fault has been resolved. It is also possible that the software switched off the fan, and therefore can no longer evaluate the feedback signal.

**Cause:** A cycle is requested that is not supported by the power unit.

Fault value (r0949, interpret hexadecimal):

0: The current control cycle is not supported.

1: The DRIVE-CLiQ cycle is not supported.

2: Internal timing problem (clearance between RX and TX instants too low).

3: Internal timing problem (TX instant too early).

**Remedy:** The power unit only supports the following cycles:

62.5 µs, 125 µs, 250 µs and 500 µs

For fault value = 0:

Set a permitted current control cycle.

For fault value = 1:

## 4 Faults and alarms

### 4.2 List of faults and alarms

- U/f operation: rated current of motor much greater than that of power unit.
- infeed: High discharge and post-charging currents for line voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at switch-on as there is no commutating reactor.
- power cables are not correctly connected.
- power cables exceed the maximum permissible length.
- power unit defective.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (switched off) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

#### Remedy:

- check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star-delta)
- U/f operation: Increase up ramp.
- U/f operation: Check assignment of rated currents of motor and power unit.
- infeed: Check the line supply quality.
- infeed: Reduce the motor load.
- infeed: Correct connection of the line reactor.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

For a parallel switching device (r0108.15 = 1) the following additionally applies:

- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).

<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The drive-integrated "Safety Integrated" function in monitoring channel 2 has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of monitoring channel 2). - forced checking procedure (test stop) of the safety switch-off signal path of monitoring channel 2 unsuccessful. - subsequent response to fault F30611 (defect in a monitoring channel). Fault value (r0949, interpret decimal): 0: stop request from the Control Unit. 1005: - STO active, although STO not selected and there is no internal STOP A active. - For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0). 1010: STO inactive although STO is selected or an internal STOP A is present. 1011: internal error for STO deselected in monitoring channel 2. 1020: Internal software error in the "Internal voltage protection" function. The "internal voltage protection" function is withdrawn. A STOP A that cannot be acknowledged is initiated. 9999: Subsequent response to fault F30611.

- Remedy:**
- select Safe Torque Off and de-select again.
  - carry out a POWER ON (switch-off/switch-on) for all components.
  - replace the Motor Module involved.
- For fault value = 1005:
- deactivate terminals STO\_A/STO\_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function.

For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety message C01611.

**Remedy:**

For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the wiring of the safety-relevant inputs (SGE) on the Control Unit (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1950:

- operate the module in the permissible range.
- check the module fan, replace the Motor Module involved.

For fault value = 1951:

- operate the module in the permissible range.
- replace the Motor Module involved.

For fault value = 1952:

- replace the Motor Module involved.

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check why STO was selected in r9872. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

### 4.2 List of faults and alarms

83: Safe Brake Adapter: Fault for the operation "close brake".

84, 85:

Safe Brake Adapter:

Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control).

90:

Brake released for service purposes (X4).

91:

Fault in "open holding brake" operation.

- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).

**Remedy:**

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).

- select Safe Torque Off and de-select again.

- check the motor holding brake connection.

- check the function of the motor holding brake.

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).

- replace the Motor Module involved.

Operation with Safe Brake Module or Safe Brake Adapter:

- check the Safe Brake Module or Safe Brake Adapter connection.

- Replace the Safe Brake Module or Safe Brake Adapter.

Safety monitoring channel has identified an error (10)

**Drive object:**

VECTOR\_G

**Component:**

None

**Propagation:**

**Reaction:**

NONE

**Acknowledge:**

NONE

**Cause:**

The Motor Module has detected a communication error with the higher-level control or the TM54F to transfer the safety-relevant information or there is a communication error between Motor Modules connected in parallel.

Note:

This fault results in a STOP A that can be acknowledged.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

For the higher-level control, the following applies:

- check the PROFIsafe address in the higher-level control and Motor Modules and if required, align.

- save all parameters (p0977 = 1).

- carry out a POWER ON (switch-off/switch-on) for all components.

For TM54F, carry out the following steps:

- start the copy function for the node identifier (p9700 = 1D hex).
- acknowledge hardware CRC (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For a parallel connection, the following applies:

- check the PROFIsafe address in both monitoring channels and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following generally applies:

- upgrade the Motor Module software.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- re-commission the Safety Integrated function and carry out a POWER ON.
- upgrade the Motor Module/Hydraulic Module software.
- contact Technical Support.
- replace the Motor Module/Hydraulic Module.

### F30650

#### SI P2: Acceptance test required

**Message value:** %1

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** VECTOR\_G

**Component:** Power Module

**Propagation:** LOCAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The "Safety Integrated" function on monitoring channel 2 requires an acceptance test.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

130: Safety parameters for monitoring channel 2 not available.

Note:

This fault value is always output when Safety Integrated is commissioned for the first time.

1000: Reference and actual checksum in monitoring channel 2 are not identical (booting).

- as a result of the changed current controller sampling time (p0115[0]), the clock cycle time for the Safety Integrated Basic Functions (r9880) was adapted.

- safety parameters set offline and loaded into the Control Unit.

- a download was made to the SINAMICS, whose firmware versions in monitoring channel 2 did not correspond to the latest version. The request to switch off the DRIVE-CLiQ component A1007 was present after the download.

- at least one checksum-checked piece of data is defective.

2000: Reference and actual checksum in monitoring channel 2 are not identical (commissioning mode).

- reference checksum on monitoring channel 2 incorrectly entered (p9899 not equal to r9898).

2003: Acceptance test is required as a safety parameter has been changed.

2005: The safety logbook has identified that the safety checksums have changed. An acceptance test is required.

3003: Acceptance test is required as a hardware-related safety parameter has been changed.

9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

Remedy:

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- check the Safety Integrated Basic Functions (r9880) and adapt the reference checksum (p9899).

- again carry out safety commissioning routine.

- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

- switch off and switch on the drive unit and DRIVE-CLiQ components. If A30650 is still present, repeat the download.

- replace the memory card or Control Unit.

For fault value = 2000:

- check the safety parameters on monitoring channel 2 and adapt the reference checksum (p9899).

For fault value = 2003, 2005:

- carry out an acceptance test and generate an acceptance report.

The procedure when carrying out an acceptance test as well as an example of the acceptance report are provided in the following literature:

SINAMICS S120 Function Manual Safety Integrated

For fault value = 3003:

- carry out the function checks for the modified hardware and generate an acceptance report.

The procedure when carrying out an acceptance test as well as an example of the acceptance report are provided in the following literature:

SINAMICS S120 Function Manual Safety Integrated

For fault value = 9999:

- carry out diagnostics for the other safety-related fault that is present.

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** VECTOR\_G

**Component:** None

**Propagation:** LOCAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An error has occurred when aligning the Safety Integrated monitoring functions of both monitoring channels. No common set of supported SI monitoring functions was able to be determined.

- there is either a DRIVE-CLiQ communication error or communication has failed.

- Safety Integrated software releases on the Control Unit and Motor Module/Hydraulic Module are not compatible with one another.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

- Remedy:**
- carry out a POWER ON (switch-off/switch-on) for all components.
  - upgrade the Motor Module/Hydraulic Module software.
  - upgrade the Control Unit software.
  - check the electrical cabinet design and cable routing for EMC compliance

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** At least one enabled "Safety Cam" (SCA) is parameterized in p9336 or p9337 too close to the tolerance range around the modulo position.

- the minus position value of a cam must be greater than the lower modulo limit + cam tolerance (p9340) + position tolerance (p9342).

- the plus position value of a cam must be less than the upper modulo limit - cam tolerance (p9340) - position tolerance (p9342).

- when the modulo position is parameterized (p9305 > 0), the lower modulo limit = 0, the upper modulo limit = p9305.

- the cam length of cam x = p9336[x] - p9337[x] is less than the cam tolerance + position tolerance (= p9340 + p9342).

This also means that cams of the minus position value must be less than the plus position value.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFISafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611 of the Control Unit.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

**Remedy:**

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.
- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed for pulse enable (independent of whether with encoder or without encoder).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual value, if necessary increase the position tolerance (p9342) and/or cam tolerance (p9340).

For message value = 1024:

- check the communication link.
- if required, increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components.
- replace the hardware.

For message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

Adapt the encoder parameterization for the second channel as follows:

- set the encoder type (p0400).
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for encoder parameters (p9700 = 46).
- exit the safety commissioning mode (p0010 = 0).
- save parameter in a non-volatile fashion (copy RAM to ROM).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1040:

- de-select encoderless monitoring functions, select and de-select STO.
- if monitoring function "SLS" is active, issue a pulse enable within 5 s of de-selecting STO.

For message value = 6000 ... 6999:

- the significance of the individual message values is described in safety fault F01611 of the Control Unit.

For other message values:

- the significance of the individual message values is described in safety message C01711.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

<b>Cause:</b>	The failsafe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002/p10102. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex xxxx: Discrepancy error for failsafe digital inputs (F-DI). Bit 0: Discrepancy error for F-DI 0 Bit 1: Discrepancy error for F-DI 1 ... yyyy: Discrepancy error for failsafe digital outputs (F-DO). Bit 0: Discrepancy error for F-DO 0 ... Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.
<b>Remedy:</b>	- check the wiring of the F-DI (contact problems). Note: This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment). Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10106, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9307.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10102, then the following formulas should be checked: - $p10102 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10102 \geq p9300$ (discrepancy time must be at least p9300) - $p10102 > td$ (discrepancy time must be greater than the switch discrepancy time that may actually occur)

## 4 Faults and alarms

### 4.2 List of faults and alarms

td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9300).

tp = period for a switching operation in ms.

When debounce p10017 is active, the discrepancy time is directly specified by the debounce time.

If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked.

-  $p11002 < p10117 + 1 \text{ ms} - td$

-  $p10102 > td$

-  $p10102 \geq p9300$

Example:

For a 12 ms SI monitoring cycle and a switching frequency of 110 ms ( $p10117 = 0$ ), the maximum discrepancy time which can be set is as follows:

$p10102 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$

Rounded-off,  $p10102 \leq 36 \text{ ms}$  is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).

Example:

Fault F01773 (P1) is signaled with fault value = 0001\_0127 and fault F30773 (P2) is signaled with fault value 0000\_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001\_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000\_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

**Remedy:**

Check the wiring of the failsafe digital output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.

- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

**A30788 Automatic test stop: wait for STO deselection via SMM**

**Message value:** -  
**Message class:** Safety monitoring channel has identified an error (10)  
**Drive object:** VECTOR\_G  
**Component:** Motor **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The automatic test stop was not able to be carried out after powering up.  
Possible causes:  
- the STO function is selected via Safety Extended Functions.  
- a safety message is present, that resulted in a STO.  
**Remedy:** - Deselect STO via Safety Extended Functions.  
- remove the cause of the safety messages and acknowledge the messages.  
The automatic test stop is performed after removing the cause.

**C30797 SI Motion P2: Axis not safely referenced**

**Message value:** %1  
**Message class:** Safety monitoring channel has identified an error (10)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The standstill position saved before switching off does not match the actual position determined at switch-on.  
Message value (r9749, interpret decimal):  
1: Axis not safely referenced.  
2: User agreement missing.  
**Remedy:** If safe automatic referencing is not possible the user must issue a user agreement for the new position using the softkey. This mean that this position is then designated as safety-relevant.

#### **A30853 Power unit: Sign-of-life error cyclic data**

**Message value:** -

**Message class:** General drive fault (19)

**Drive object:** B\_INF, VECTOR\_G

**Component:** Control Unit (CU)

**Propagation:** LOCAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The power unit has detected that the cyclic setpoint telegrams of the Control Unit have not been updated on time. At least two sign-of-life errors have occurred within the window set in p7788.

- Remedy:**
- reduce the size of the window (p7788) for monitoring.
  - check the Motor Module, and if required replace.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the power unit in the telegram and in the receive list do not match.

9 (= 09 hex):

The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

16 (= 10 hex):

The receive telegram is too early.

17 (= 11 hex):

CRC error and the receive telegram is too early.

18 (= 12 hex):

The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early.

19 (= 13 hex):

The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early.

20 (= 14 hex):

The length of the receive telegram does not match the receive list and the receive telegram is too early.

21 (= 15 hex):

The type of the receive telegram does not match the receive list and the receive telegram is too early.

22 (= 16 hex):  
The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early.

25 (= 19 hex):  
The error bit in the receive telegram is set and the receive telegram is too early.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

**Component:** Power Module **Propagation:** LOCAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.  
 Fault cause:  
 9 (= 09 hex):  
 The power supply voltage for the components has failed.  
 Note regarding the message value:  
 The individual information is coded as follows in the message value (r0949/r2124):  
 0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the power supply voltage wiring for the DRIVE-CLiQ component (interrupted cable, contacts, ...).
- check the dimensioning of the power supply for the DRIVE-CLiQ component.

<b>F31100 (N, A)</b>	<b>Encoder 1: Zero mark distance error</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	B_INF, ENC, VECTOR_G
<b>Component:</b>	Encoder 1 <b>Propagation:</b> LOCAL
<b>Reaction:</b>	Vector: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2) Infeed: NONE (OFF1, OFF2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance. See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

<b>Cause:</b>	The 1.5 x parameterized zero mark distance was exceeded. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse). <b>Drive object:</b>	B_INF, ENC, VECTOR_G
<b>Component:</b>	Encoder 1
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	Vector: ENCODER (IASC/DCBRK, NONE) Infeed: NONE
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The zero mark signal level (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign) The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module. The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV). The signal level is not evaluated unless the following conditions are satisfied: - Sensor Module properties available (r0459.31 = 1). - monitoring active (p0437.31 = 1). See also: p0491 (Motor encoder fault response ENCODER)
<b>Remedy:</b>	- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections and contacts of the encoder cable. - check the encoder type (encoder with zero marks). - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly (not connected with the incorrect polarity). - replace the encoder cable. - if the coding disk is soiled or the lighting aged, replace the encoder.

**Acknowledge:** PULSE INHIBIT

**Cause:** After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.

When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.

When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex

yyyy: Determined mechanical zero mark position (can only be used for track C/D).

xxxx: Deviation of the zero mark from the expected position as electrical angle.

**Remedy:**

- check p0431 and, if necessary, correct (trigger via p1990 = 1 if necessary).
- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- if the Hall sensor is used as an equivalent for track C/D, check the connection.

#### **F31131 (N, A) Encoder 1: Position deviation incremental/absolute too high**

**Message value:** %1

**Message class:** Actual position/speed value incorrect or not available (11)

**Drive object:** B\_INF, ENC, VECTOR\_G

**Component:** Encoder 1 **Propagation:** LOCAL

**Reaction:** Vector: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)

Infeed: NONE

**Acknowledge:** PULSE INHIBIT

**Cause:** Absolute encoder:

When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.

Limit value for the deviation:

- EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).

- other encoders: 15 pulses = 60 quadrants.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check whether the coding disk is dirty or there are strong ambient magnetic fields.
- adapt the parameter for the clearance between zero marks (p0425).
- if message output above speed threshold, reduce filter time if necessary (p0438).

<b>A31400 (F, N)</b>	<b>Encoder 1: Zero mark distance error (alarm threshold exceeded)</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	B_INF, ENC, VECTOR_G
<b>Component:</b>	Encoder 1
<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - replace the encoder or encoder cable.

Note for Sensor Modules for resolvers (e.g. SMC10): The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms). A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec. #### **A31432 (F, N) Encoder 1: Rotor position adaptation corrects deviation**

**Message value:** %1  
**Message class:** Actual position/speed value incorrect or not available (11)  
**Drive object:** B\_INF, ENC, VECTOR\_G  
**Component:** Encoder 1 **Propagation:** LOCAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** On track A/B, pulses have been lost or too many have been counted. These pulses are presently being corrected.  
Alarm value (r2124, interpret decimal):  
Last measured deviation of zero mark in increments (4 increments = 1 encoder pulse).  
The sign designates the direction of motion when detecting the zero mark distance.  
**Remedy:**  
- check that the encoder cables are routed in compliance with EMC.  
- check the plug connections.  
- replace the encoder or encoder cable.  
- check encoder limit frequency.  
- adapt the parameter for the distance between zero marks (p0424, p0425).

<b>Component:</b>	None	<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	Vector: OFF1 (NONE, OFF2, OFF3) Infeed: OFF1 (NONE, OFF2)		
<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).		
<b>Remedy:</b>	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

**A31811 (F, N) Encoder 1: Encoder serial number changed**

**Message value:** -

**Message class:** Error in the parameterization / configuration / commissioning procedure (18)

**Drive object:** B\_INF, ENC, VECTOR\_G

**Component:** Encoder 1

**Propagation:** LOCAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).

Cause 1:

- the encoder was replaced.

Cause 2:

- a third-party, built-in or linear motor was re-commissioned.

Cause 3:

- the motor with integrated and adjusted encoder was replaced.

**Cause 4:**

- the firmware was updated to a version that checks the encoder serial number.

**Note:**

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2118, p2119).

See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:**

For causes 1, 2:

Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.

**SERVO:**

If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.

or

Set the adjustment via p0431. In this case, the new serial number is automatically accepted.

or

Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

For causes 3, 4:

Accept the new serial number with p0440 = 1.

**Acknowledge:** IMMEDIATELY  
**Cause:** An error was identified in the encoder parameterization.  
It is possible that the parameterized encoder type does not match the connected encoder.  
The parameter involved can be determined as follows:  
- determine the parameter number using the fault value (r0949).  
- determine the parameter index (p0187).  
Fault value (r0949, interpret decimal):  
yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter

For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.  
yyyy = 0:  
No additional information available.  
yyyy = 1:

See also: p0491 (Motor encoder fault response ENCODER)  
**Remedy:**  
- check whether the connected encoder type matches the encoder that has been parameterized.  
- correct the parameter specified by the fault value (r0949) and p0187.  
- re parameter number = 314:  
- check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 \* p0433) / p0432 <= 1000).

**Cause:** An encoder parameter was detected as being incorrect.  
It is possible that the parameterized encoder type does not match the connected encoder.  
The parameter involved can be determined as follows:  
- determine the parameter number using the fault value (r0949).  
- determine the parameter index (p0187).  
Fault value (r0949, interpret decimal):

## 4 Faults and alarms

### 4.2 List of faults and alarms

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms).

The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.

- replace the encoder or encoder cable.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = amplitude, i.e. root of  $A^2 + B^2$  (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold for ( $|A| + |B|$ ) is > 1120 mV or the root of  $(A^2 + B^2) > 955$  mV.

A signal level of 500 mV peak value corresponds to the numerical value of 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.

- replace the encoder or encoder cable.

#### **F32129 (N, A) Encoder 2: Position difference hall sensor/track C/D and A/B too large**

**Message value:** %1

**Message class:** Actual position/speed value incorrect or not available (11)

**Drive object:** VECTOR\_G

**Component:** Encoder 2

**Propagation:** LOCAL

**Reaction:** OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical.

One period of track C/D corresponds to 360 ° mechanical.

One period of the Hall signal corresponds to 360 ° electrical.

The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

After the fine synchronization using one reference mark or 2 reference marks for distance-coded encoders, this fault is no longer initiated, but instead, Alarm A32429.

Fault value (r0949, interpret decimal):

For track C/D, the following applies:

Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °).

For Hall signals, the following applies:

Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).

**Remedy:**

- track C or D not connected.
- correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
- check that the encoder cables are routed in compliance with EMC.
- check the adjustment of the Hall sensor.

**Drive object:** VECTOR\_G

**Component:** Encoder 2

**Propagation:** LOCAL

**Reaction:** OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:**

After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.

When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.

When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex

yyyy: Determined mechanical zero mark position (can only be used for track C/D).

xxxx: Deviation of the zero mark from the expected position as electrical angle.

Scaling: 32768 dec = 180 °

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- if the Hall sensor is used as an equivalent for track C/D, check the connection.
- check the connection of track C or D.
- replace the encoder or encoder cable.

<b>F32131 (N, A)</b>	<b>Encoder 2: Position deviation incremental/absolute too high</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Encoder 2 <span style="float: right;"><b>Propagation:</b> LOCAL</span>
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	Absolute encoder: When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected. Limit value for the deviation: - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants). - other encoders: 15 pulses = 60 quadrants. Incremental encoder: When the zero pulse is passed, a deviation in the incremental position was detected. For equidistant zero marks, the following applies: - the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark. For distance-coded zero marks, the following applies: - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair. Fault value (r0949, interpret decimal): Deviation in quadrants (1 pulse = 4 quadrants).
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - check whether the coding disk is dirty or there are strong ambient magnetic fields. - adapt the parameter for the clearance between zero marks (p0425). - if message output above speed threshold, reduce filter time if necessary (p0438).

<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Encoder 2
<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - replace the encoder or encoder cable.

**Cause:** The signal level ( $C^2 + D^2$ ) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track D (16 bits with sign).

xxxx = Signal level, track C (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV  $-25/+20$  %).

The response thresholds are  $< 230$  mV (observe the frequency response of the encoder) and  $> 750$  mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV  $-25/+20$  %).

The response threshold is  $< 230$  mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

<b>Cause:</b>	On track A/B, pulses have been lost or too many have been counted. These pulses are presently being corrected. Alarm value (r2124, interpret decimal): Last measured deviation of zero mark in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - check encoder limit frequency. - adapt the parameter for the distance between zero marks (p0424, p0425).

### 4.2 List of faults and alarms

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections and contacts of the encoder cable.
- are the C/D tracks connected correctly (have the signal cables CP and CN or DP and DN been interchanged)?
- replace the encoder cable.

<b>Component:</b>	None <span style="float: right;"><b>Propagation:</b> GLOBAL</span>
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
<b>Remedy:</b>	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	A fault occurred on the Sensor Module for encoder 2 that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit. Fault value (r0949, interpret decimal): Fault number. Note: If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

- yyyy = 6:  
DRIVE-CLiQ encoder cannot be used with this firmware version.
- yyyy = 7:  
For an SQW encoder, the XIST1 correction (p0437.2) is only permitted for equidistant zero marks.
- yyyy = 8:

**Cause:**

- The selected device combination is not supported.
- Fault value (r0949, interpret decimal):
- 1003:  
The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of 2<sup>n</sup>.
  - 1005:  
The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.
  - 1006:  
The maximum duration of the EnDat transfer (31.25 μs) was exceeded.
  - 2001:  
The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.
  - 2002:  
The resolution of the linear measuring unit does not match the pole pair width of the linear motor  
Pole pair width, minimum = p0422 \* 2<sup>20</sup>
- Remedy:**
- For fault value = 1003, 1005, 1006:  
- Use a measuring unit that is permissible.
  - For fault value = 2001:  
- set a permissible cycle combination (if required, use standard settings).

<b>Component:</b>	Encoder 3
<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance.
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

<b>F33131 (N, A)</b>	<b>Encoder 3: Position deviation incremental/absolute too high</b>
<b>Message value:</b>	%1
<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	Encoder 3
<b>Propagation:</b>	LOCAL
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	Absolute encoder: When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected. Limit value for the deviation: - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants). - other encoders: 15 pulses = 60 quadrants. Incremental encoder: When the zero pulse is passed, a deviation in the incremental position was detected. For equidistant zero marks, the following applies: - the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark. For distance-coded zero marks, the following applies: - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair. Fault value (r0949, interpret decimal): Deviation in quadrants (1 pulse = 4 quadrants).
<b>Remedy:</b>	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - replace the encoder or encoder cable. - check whether the coding disk is dirty or there are strong ambient magnetic fields. - adapt the parameter for the clearance between zero marks (p0425). - if message output above speed threshold, reduce filter time if necessary (p0438).

<b>Component:</b>	Encoder 3
<b>Propagation:</b>	GLOBAL
<b>Reaction:</b>	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
<b>Acknowledge:</b>	PULSE INHIBIT
<b>Cause:</b>	The encoder has identified a position determination fault (singleturn) and supplies status information bit by bit in an internal status/fault word. Some of these bits cause this fault to be triggered. Other bits are status displays. The status/fault word is displayed in the fault value. Note regarding the bit designation: The first designation is valid for DRIVE-CLiQ encoders, the second for EnDat 2.2 encoders. Fault value (r0949, interpret binary): Bit 0: F1 (safety status display). Bit 1: F2 (safety status display). Bit 2: Reserved (lighting). Bit 3: Reserved (signal amplitude).

- Bit 4: Reserved (position value).
- Bit 5: Reserved (overvoltage).

- Bit 31: Multiturn battery (reserved).

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- replace the encoder if necessary.

Note:

An EnDat 2.2 encoder may only be removed and inserted in the "Park" state.

If an EnDat 2.2 encoder was removed when not in the "Park" state, then after inserting the encoder, a POWER ON (switch-off/switch-on) is necessary to acknowledge the fault.

**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The signal level ( $C^2 + D^2$ ) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.  
 Alarm value (r2124, interpret hexadecimal):  
 yyyyxxxx hex:  
 yyyy = Signal level, track D (16 bits with sign).  
 xxxx = Signal level, track C (16 bits with sign).  
 The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
 The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.  
 A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

**Note:**

If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.

 xxxx = amplitude, i.e. root of  $A^2 + B^2$  (16 bits without sign)  
 The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
 The response threshold is < 230 mV (observe the frequency response of the encoder).  
 A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.  
 The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).

**Cause:** The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical.  
One period of track C/D corresponds to 360 ° mechanical.  
One period of the Hall signal corresponds to 360 ° electrical.  
The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.  
Alarm value (r2124, interpret decimal):

<b>Message class:</b>	Actual position/speed value incorrect or not available (11)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	None <span style="float: right;"><b>Propagation:</b> GLOBAL</span>
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
<b>Remedy:</b>	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

<b>Component:</b>	None <span style="float: right;"><b>Propagation:</b> GLOBAL</span>
<b>Reaction:</b>	OFF1 (NONE, OFF2, OFF3)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	When switched off, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r0477. See also: p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)
<b>Remedy:</b>	Reset the position tracking as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507). See also: p0010

**Drive object:** VECTOR\_G  
**Component:** Sensor Module Encoder 3 **Propagation:** LOCAL  
**Reaction:** OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** An error was identified in the encoder parameterization.  
It is possible that the parameterized encoder type does not match the connected encoder.  
The parameter involved can be determined as follows:  
- determine the parameter number using the fault value (r0949).  
- determine the parameter index (p0187).

Fault value (r0949, interpret decimal):

yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter

xxxx = 421:

For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.

yyyy = 0:

No additional information available.

yyyy = 1:

The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).

yyyy = 2:

A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please start a new encoder identification.

yyyy = 3:

A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please select a listed encoder in p0400 with a code number < 10000.

yyyy = 4:

This component does not support SSI encoders (p0404.9 = 1) without track A/B.

yyyy = 5:

For SQW encoder, value in p4686 greater than in p0425.

yyyy = 6:

DRIVE-CLiQ encoder cannot be used with this firmware version.

yyyy = 7:

For an SQW encoder, the XIST1 correction (p0437.2) is only permitted for equidistant zero marks.

yyyy = 8:

The motor pole pair width is not supported by the linear scale being used.

yyyy = 9:

The length of the position in the EnDat protocol may be a maximum of 32 bits.

yyyy = 10:

The connected encoder is not supported.

yyyy = 11:

The hardware does not support track monitoring.

**Remedy:**

- check whether the connected encoder type matches the encoder that has been parameterized.
- correct the parameter specified by the fault value (r0949) and p0187.
- re parameter number = 314:
- check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 \* p0433) / p0432 <= 1000).

**Drive object:** VECTOR\_G  
**Component:** Encoder 3 **Propagation:** GLOBAL  
**Reaction:** OFF1 (IASC/DCBRK, NONE)  
**Acknowledge:** PULSE INHIBIT  
**Cause:** The selected device combination is not supported.  
 Fault value (r0949, interpret decimal):  
 1003:  
 The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of 2^n.  
 1005:  
 The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.  
 1006:  
 The maximum duration of the EnDat transfer (31.25 µs) was exceeded.

2001:

The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.

2002:

The resolution of the linear measuring unit does not match the pole pair width of the linear motor

Pole pair width, minimum =  $p0422 \cdot 2^20$

**Remedy:**

For fault value = 1003, 1005, 1006:

- Use a measuring unit that is permissible.

For fault value = 2001:

- set a permissible cycle combination (if required, use standard settings).

For fault value = 2002:

- Use a measuring unit with a lower resolution (p0422).

419:

When the fine resolution Gx\_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.

**Remedy:**

For alarm value = 1:

No re-parameterization between fault/alarm.

For alarm value = 419:

Reduce the fine resolution (p0419) or deactivate the monitoring (p0437.25), if the complete multiturn range is not required.

<b>Acknowledge:</b>	IMMEDIATELY		
<b>Cause:</b>	A DRIVE-CLiQ communications error has occurred from the Control Unit to the Voltage Sensing Module involved. Fault cause: 1 (= 01 hex): Checksum error (CRC error). 2 (= 02 hex): Telegram is shorter than specified in the length byte or in the receive list. 3 (= 03 hex): Telegram is longer than specified in the length byte or in the receive list. 4 (= 04 hex): The length of the receive telegram does not match the receive list. 5 (= 05 hex): The type of the receive telegram does not match the receive list. 6 (= 06 hex): The address of the component in the telegram and in the receive list do not match. 7 (= 07 hex): A SYNC telegram is expected - but the received telegram is not a SYNC telegram. 8 (= 08 hex): No SYNC telegram is expected - but the received telegram is one. 9 (= 09 hex): The error bit in the receive telegram is set. 16 (= 10 hex): The receive telegram is too early.		

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

**F34835****VSM DRIVE-CLiQ: Cyclic data transfer error****Message value:**

**Acknowledge:** IMMEDIATELY  
**Cause:** The properties of the DRIVE-CLiQ component (Voltage Sensing Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.  
Fault value (r0949, interpret decimal):  
Component number.  
**Remedy:**
  - carry out a POWER ON.
  - when a component is replaced, the same component type and if possible the same firmware version should be used.
  - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

## 4 Faults and alarms

### 4.2 List of faults and alarms

**Note:**

This error is also signaled if a drive controlled with TM54F is parameterized so that the basic functions are controlled via TM54F - and simultaneously the extended safety functions or ncSI have been parameterized.

The following applies for fault value = 0:

- since the firmware update of the TM54F it has not been switched off.

- the firmware of the connected TM54F is too old.

See also: p10010 (SI TM54F drive object assignment)

**Remedy:**

For a fault value in the range from bit 0 ... 5:

- First check that all drives are entered in p10010,

extended safety functions or basic functions have been enabled via TM54F.

- Execute the copy function for TM54F(p9700 = 87).

- adapt the checksums for TM54F(p9701 = 172).

- copy RAM to ROM.

- carry out a POWER ON.

For a fault value in the range from bit 16 ... 21:

Increase the current controller sampling time of the corresponding drive, in order to avoid faults in operation.

- Execute the copy function for TM54F(p9700 = 87).

- adapt the checksums for TM54F(p9701 = 172).

- copy RAM to ROM.

- carry out a POWER ON.

**Cause:**

The functionality of the basic functions via TM54F is used.

Drive groups have been incorrectly parameterized (incorrect parameter assignment).

Fault value (r0949, interpret binary):

The value specifies in which drive group Basic Safety drives are mixed with Extended Safety drives.

Bit 0 = 1: drive group 1 error

Bit 1 = 1: drive group 2 error

Bit 2 = 1: drive group 3 error

Bit 3 = 1: drive group 4 error

As long as this fault is present, Failsafe Values are activated in TM54F. All the drives are not enabled.

Note:

-this error is also signaled if a drive controlled with TM54F is parameterized so that the basic functions are controlled via TM54F and simultaneously extended safety functions or ncSI have been parameterized.

**Remedy:** Corresponding to the fault value, p10011 should be checked to ensure that no Basic Safety drives are mixed with Extended Safety drives in a drive group.

## Example:

If an error with fault causes bb = 02 hex or 04 hex occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.

Master signals fault value 0001\_04AF and slave signals fault value 0001\_04A4.

aaaa = 1 --> F-DO 0 is involved.

bb = 04 hex --> the test of the Diag-DO was unsuccessful.

cc = The expected states were tested in test stop step AF on the master and A4 on the slave.

The expected state Diag-DO = 0 V was checked in the table, i.e. Diag-DO was at 0 V instead of the expected 24 V.

The associated test action took place in the previous step (99 hex DO OFF, A4 hex DO OFF). Both DOs were switched to OFF.

**Remedy:**

Check the wiring of the F-DIs and F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

For fault value = CCCCCCCC hex, DDDDDDDD hex, EEEEEEEE hex the following applies:

These fault values occur together with fault F35152. Possible countermeasure:

- check all parameters for the test stop.
- you should also check whether the firmware version of the TM54F matches that of the Control Unit.
- check p10001, p10017, p10046 and p10047.

A POWER ON must be carried out after correcting the parameters.

**Drive object:** B\_INF, TM54F\_MA, TM54F\_SL, VECTOR\_G

**Component:** Terminal Module (TM)

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The time set in p10003 for the forced checking procedure (test stop) for the digital inputs/outputs has been exceeded. A new forced checking procedure is required.

After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

Note:

- this message does not result in a safety stop response.
- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also: p10003 (SI TM54F forced checking procedure timer)

**Remedy:**

Carry out the forced checking procedure for the digital inputs/outputs.

The signal source to select the forced checking procedure is set via binector input p10007.

**A35015****TM54F: Motor/Hydraulic Module replaced or configuration inconsistent**

**Message value:** Fault cause: %1 bin

**Drive object:** B\_INF, TM54F\_MA, TM54F\_SL, VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Cyclic communication of at least one drive with the Terminal Module 54F (TM54F) is not active.

Possible causes:

- at least one Motor Module/Hydraulic Module was replaced (e.g. hardware was replaced).
- the parameterization of the TM54F (p10010) is inconsistent with the number of drives, which have drive-based motion monitoring functions activated with TM54F.

- For the signaled drive, it is not permissible that the "Safe motion monitoring without selection" (p9601.5 = 1) is parameterized.
- And activated drive has no communication via DRIVE-CLiQ.
- p10010 of the TM54F master module is not the same as p10010 of the TM54F slave module (in this case, F35051 is also output).
- in p10010 of the TM54F master or slave module, the number of a drive object was entered several times.
- the control of the Basis Functions via TM54F was parameterized, and simultaneously the Extended Safety Functions or ncSI were parameterized.

Alarm value (r2124, interpret binary):

yyyy yyyy xxxx xxxx bin

xxxx xxxx bin: inconsistent configuration

Bit 0 = 1: No communication with drive 1.

...

Bit 5 = 1: No communication with drive 6.

yyyy yyyy bin: Motor Module/Hydraulic Module replaced or a DRIVE-CLiQ cable of a Motor Module/Hydraulic Module not inserted.

Bit 8 = 1: Motor Module/Hydraulic Module from drive 1 was replaced or does not communicate.

...

Bit 13 = 1: Motor Module/Hydraulic Module from drive 6 was replaced or does not communicate.

Note:

When this alarm is active, none of the drives listed in the alarm value, which have drive-based motion monitoring functions operating with TM54F, are enabled.

For alarm value = 0:

The number of drive objects specified in p10010 is not equal to the number of drives that have drive-based motion monitoring functions that have been enabled.

See also: p10010 (SI TM54F drive object assignment)

**Remedy:**

For all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).

Check as to whether F35051 is also output and remove the cause.

Check whether each drive object number is listed only once in the indices of p10010.

Note:

If a drive was deactivated and activated without first having established the DRIVE-CLiQ connection, then this alarm is also output.

When replacing a Motor Module/Hydraulic Module, carry out the following steps:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For SINUMERIK, the following applies:

HMI supports the replacement of components with Safety functions (operating area "Diagnostics" --> Softkey "Alarm list" --> Softkey "Confirm SI HW" etc.).

The precise procedure is given in the following document:

SINUMERIK Function Manual Safety Integrated

**Remedy:**

Carry out the following steps on the TM54F:

- check the specified parameters for incorrect parameterization.
  - activate the safety commissioning mode (p0010 = 95).
  - start the copy function for SI parameters (p9700 = 57 hex).
  - acknowledge complete data change (p9701 = AC hex).
  - exit the safety commissioning mode (p0010 = 0).
  - save all parameters (p0977 = 1).
  - carry out safe acknowledgment (p10006).
- For an internal software error (aaaa > 0):
- For TM54F, upgrade the firmware to a later version.
  - contact Technical Support.
  - replace the TM54F.

**F35151 TM54F: Discrepancy error**

**Drive object:** B\_INF, TM54F\_MA, TM54F\_SL, VECTOR\_G

**Component:** Terminal Module (TM) **Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The safe input terminals or output terminals have a different state for longer than the time parameterized in p10002 - or too many switching operations were carried out within a monitoring cycle p10002.  
Fault value (r0949, interpret hexadecimal):  
yyyyxxxx hex  
xxxx: The safety-relevant input terminals F-DI indicate a discrepancy.

Bit 0: Discrepancy for F-DI 0

...

Bit 9: Discrepancy for F-DI 9

yyyy: The safety-relevant output terminals F-DO indicate a discrepancy.

Bit 0: Discrepancy for F-DO 0

...

Bit 3: Discrepancy for F-DO 3

Note:

If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.

The following options are available to analyze all of the discrepancy errors:

- using the commissioning tool, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here.

- compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.

#### Remedy:

Check the wiring of the corresponding F-DI (contact problems).

If the wiring is correct and there is no wire breakage, then a check must be made as to whether the switching frequency at F-DI is too high and must therefore be reduced (switching pulses must have a longer time between them).

The time interval between each signal edge at an F-DI must be at least equal to the discrepancy time before the input is switched again.

Discrepancy errors in the failsafe digital inputs (F-DI) can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgment was carried out (see p10006). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.

Sets the discrepancy time for fast switching operations at the F-DIs:

For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:

- the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down).

- the time between two switching pulses should be longer than the discrepancy time (if necessary, round up).

- the discrepancy time must be at least r10003 (it must always be rounded up or down to be an integer multiple of the SI sampling time r10003). If a debounce time has been parameterized (p10017 > 0), then the shortest possible discrepancy time is directly specified using the debounce time.

- the period of a cyclic switching pulse must be less than half of the discrepancy time p10017 (if necessary, round down).

- the time between two fast switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up).

- the discrepancy time must be at least r10003.

The debounce time must always be set less than the discrepancy time.

Example:

If the SI sampling cycle is 12 ms and the switching frequency is 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:

$p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms}$  --> rounded-off, the following is obtained  $p10002 \leq 36 \text{ ms}$

Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time.

Basic secondary condition to set the discrepancy time:

The discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500).

<b>F35220 (N, A)</b>	<b>TM: Frequency limit reached for signal output</b>
<b>Message value:</b>	-
<b>Message class:</b>	Application/technological function faulted (17)
<b>Drive object:</b>	B_INF, TM31, VECTOR_G
<b>Component:</b>	Terminal Module (TM) <b>Propagation:</b> BICO
<b>Reaction:</b>	Vector: OFF1 (NONE, OFF2, OFF3) Infeed: OFF1 (NONE, OFF2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	The signals output from the Terminal Module 41 (TM41) for tracks A/B have reached the limit frequency. The output signals are no longer in synchronism with the specified setpoint. SIMOTION (p4400 = 0) operating mode: - if the TM41 has been configured as the technology project, this fault is also output in response to short-circuited A/B signals in X520. SINAMICS (p4400 = 1) operating mode: - the fine resolution of TM41 in p0418 does not match that of the connector input that was interconnected at p4420 - the encoder position actual value r0479 interconnected at connector input p4420 has an excessively high actual speed - the output signals correspond to a speed, which is greater than the maximum speed (r1082 of TM41).
<b>Remedy:</b>	SIMOTION (p4400 = 0) operating mode: - enter a lower speed setpoint (p1155). - reduce the encoder pulse number (p0408). - check track A/B for short-circuits. SINAMICS (p4400 = 1) operating mode: - enter a lower speed setpoint (p1155). - reduce the encoder pulse number (p0408). **F35233 DRIVE-CLiQ component function not supported**

**Message value:** %1  
**Message class:** Error in the parameterization / configuration / commissioning procedure (18)  
**Drive object:** B\_INF, TM120, TM150, TM31, VECTOR\_G  
**Component:** Terminal Module (TM) **Propagation:** BICO  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.  
Fault value (r0949, interpret decimal):  
1: Terminal Module 31 does not support the function "Timer for temperature evaluation" (X522.7/8, p4103 > 0.000).  
4: The improved actual value resolution is not supported (p4401.4).  
5: The improved setpoint resolution is not supported (p4401.5).  
6: The residual value handling in the setpoint channel cannot be deactivated (p4401.6).  
7: Output frequencies greater than 750 kHz cannot be activated (p4401.7).  
**Remedy:** For fault value = 1:  
- Deactivate timer for temperature evaluation (X522.7/8) (p4103 = 0.000).  
- use Terminal Module 31 and the relevant firmware version to enable the "Timer for temperature evaluation" function (Article No. 6SL3055-0AA00-3AA1, firmware version 2.6 and higher).

**Drive object:** B\_INF, TM150, VECTOR\_G  
**Component:** Terminal Module (TM) **Propagation:** BICO  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The temperature (r4105[6]) measured using the temperature sensing of the Terminal Module 150 (TM150) has exceeded the threshold value to initiate this alarm (p4102[12]).

Note:

For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[6] = 1, 4), the following applies:

- if r4101[6] > 1650 ohms, the temperature r4105[6] = 250 °C
- if r4101[6] <= 1650 ohms, the temperature r4105[6] = -50 °C

Alarm value (r2124, interpret decimal):

<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Drive object:</b>	B_INF, TM120, TM150, TM31, TM54F_MA, TM54F_SL, VECTOR_G
<b>Component:</b>	Terminal Module (TM) <b>Propagation:</b> LOCAL
<b>Reaction:</b>	OFF1 (OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	Fault detected on the DRIVE-CLiQ component (Terminal Module) involved. Faulty hardware cannot be excluded. Fault cause: 32 (= 20 hex): Error in the telegram header. 35 (= 23 hex): Receive error: The telegram buffer memory contains an error. 66 (= 42 hex): Send error: The telegram buffer memory contains an error. 67 (= 43 hex): Send error: The telegram buffer memory contains an error. 96 (= 60 hex): Response received too late during runtime measurement. 97 (= 61 hex): Time taken to exchange characteristic data too long. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
<b>Remedy:</b>	<ul style="list-style-type: none"> <li>- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).</li> <li>- check the electrical cabinet design and cable routing for EMC compliance</li> <li>- if required, use another DRIVE-CLiQ socket (p9904).</li> <li>- replace the component involved.</li> </ul>

<b>F35895</b>	<b>TM DRIVE-CLiQ (CU): Alternating cyclic data transfer error</b>
<b>Message value:</b>	Component number: %1, fault cause: %2
<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Drive object:</b>	B_INF, TM120, TM150, TM31, TM54F_MA, TM54F_SL, VECTOR_G
<b>Component:</b>	Terminal Module (TM) <b>Propagation:</b> LOCAL
<b>Reaction:</b>	OFF1 (OFF2)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	A DRIVE-CLiQ communication error has occurred from the Terminal Module involved (TM) to the Control Unit. Fault cause: 11 (= 0B hex): Synchronization error during alternating cyclic data transfer. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
<b>Remedy:</b>	Carry out a POWER ON.
<b>F35896</b>	<b>TM DRIVE-CLiQ (CU): Inconsistent component properties</b>

<b>Message class:</b>	Internal (DRIVE-CLiQ) communication error (12)
<b>Drive object:</b>	B_INF, TM120, TM150, TM31, TM54F_MA, TM54F_SL, VECTOR_G
<b>Component:</b>	Terminal Module (TM) <b>Propagation:</b> LOCAL
<b>Reaction:</b>	Vector: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2) Infeed: OFF2 (NONE, OFF1)
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The properties of the DRIVE-CLiQ component (Terminal Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced. Fault value (r0949, interpret decimal): Component number.
<b>Remedy:</b>	- carry out a POWER ON. - when a component is replaced, the same component type and if possible the same firmware version should be used. - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

<b>Reaction:</b>	Vector: NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2) Infeed: NONE (OFF1, OFF2)
<b>Acknowledge:</b>	IMMEDIATELY (POWER ON)
<b>Cause:</b>	A fault has occurred on the Terminal Module that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit. Fault value (r0949, interpret decimal): Fault number. Note: If required, the significance of this new fault can be read about in a more recent description of the Control Unit.
<b>Remedy:</b>	- replace the firmware on the Terminal Module by an older firmware version (r0158). - upgrade the firmware on the Control Unit (r0018).

**Message class:** Auxiliary unit faulted (20)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The cooling unit signals a general fault.  
**Remedy:**

- check the wiring between the cooling unit and the input terminal (Terminal Module).
- check the external control device for the cooling unit.

**F49151 Cooling unit: Conductivity has exceeded the fault threshold**

**Message value:** -

**Message class:** Auxiliary unit faulted (20)

**Drive object:** B\_INF, VECTOR\_G

**Component:** None **Propagation:** GLOBAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The conductivity of the cooling liquid has exceeded the selected fault threshold (p0269[2]).  
See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source)

**Remedy:** Check the device to de-ionize the cooling liquid.

**F49152 Cooling unit: ON command feedback signal missing**

**Message value:** -

**Message class:** Auxiliary unit faulted (20)

**Drive object:** B\_INF, VECTOR\_G

**Component:** None **Propagation:** GLOBAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The feedback signal of the ON command of the cooling unit is missing.  
- after the ON command, the feedback signal has not been received within the selected starting time (p0260).  
- the feedback signal has failed in operation.  
- the cooling system was stopped by an external signal.  
See also: p0260 (Cooling unit starting time 1), r0267 (Cooling unit status word)

**Remedy:** - check the wiring between the cooling unit and the input terminal (Terminal Module).  
- check the wiring between the output terminal (Terminal Module) and the cooling system.  
- check the external control device for the cooling unit.

**F49153 Cooling unit: Liquid flow too low**

**Message value:** -

**Message class:** Auxiliary unit faulted (20)

**Drive object:** B\_INF, VECTOR\_G

**Component:** None **Propagation:** GLOBAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The drive converter cooling unit signals that the cooling liquid flow is too low.  
- after the ON command, the feedback signal has not been received within the selected starting time (p0260).  
- in operation, the feedback signal has failed for longer than the permitted failure time (p0263).  
See also: p0260 (Cooling unit starting time 1), p0263 (Cooling unit fault liquid flow delay time), r0267 (Cooling unit status word)

**Remedy:** - check the wiring between the cooling unit and the input terminal (Terminal Module).  
- check the external control device for the cooling unit.

**F49154 (A) Cooling unit: Liquid leak is present**

**Message value:** -

**Message class:** Auxiliary unit faulted (20)

**Drive object:** B\_INF, VECTOR\_G

**Component:** None **Propagation:** GLOBAL

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The liquid leakage monitoring function has responded.  
Caution:  
If this fault is reparameterized as an alarm, then using other monitoring functions it must be ensured that when cooling water is lost, the drive is switched off!

**F49155 Cooling unit: Power Stack Adapter, firmware version too old**

**Message value:** -  
**Message class:** Auxiliary unit faulted (20)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.  
**Remedy:** Upgrade the firmware. Check EEPROM data.

---

**F49156 Cooling unit: Cooling liquid temperature has exceeded the fault threshold**

**Message value:** -  
**Message class:** Auxiliary unit faulted (20)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The cooling liquid intake temperature has exceeded the specified fault threshold.  
**Note:**  
The value for the fault threshold depends on the power unit (hardware description data, e.g. 52 ... 55 °C).  
**Remedy:** Check the cooling system and the ambient conditions.

**A49170 Cooling unit: Alarm has occurred**

**Message value:** -  
**Message class:** Auxiliary unit faulted (20)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The cooling unit signals a general alarm.  
**Remedy:** - check the wiring between the cooling unit and the input terminal (Terminal Module).  
- check the external control device for the cooling unit.

---

**A49171 (N) Cooling unit: Conductivity has exceeded the alarm threshold**

**Message value:** -  
**Message class:** Auxiliary unit faulted (20)  
**Drive object:** VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Conductivity monitoring is set for the cooling liquid (r0267.7, from p0266[7]).  
See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source), r0267 (Cooling unit status word)  
**Remedy:** Check the device to de-ionize the cooling liquid.  
Reaction upon N: NONE  
Acknowl. upon N: NONE

<b>A49171 (N)</b>	<b>Cooling unit: Conductivity has exceeded the alarm threshold</b>
<b>Message value:</b>	-
<b>Message class:</b>	Auxiliary unit faulted (20)
<b>Drive object:</b>	B_INF
<b>Component:</b>	None
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The conductivity of the cooling liquid has exceeded the selected alarm threshold (p0269[1]). Note: The threshold cannot be set higher than the fault threshold specified in the equipment description.
<b>Remedy:</b>	Check the device to de-ionize the cooling liquid.
Reaction upon N:	NONE
Acknowl. upon N:	NONE

<b>A49172</b>	<b>Cooling unit: Conductivity actual value is not valid</b>
<b>Message value:</b>	-
<b>Message class:</b>	Auxiliary unit faulted (20)
<b>Drive object:</b>	B_INF, VECTOR_G
<b>Component:</b>	None
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	When monitoring the conductivity of the cooling liquid, there is a fault in the wiring or in the sensor.
<b>Remedy:</b>	- check the wiring between the cooling unit and the Power Stack Adapter (PSA). - check the function of the sensor to measure the conductivity.

---

<b>A49173</b>	<b>Cooling unit: Cooling liquid temperature has exceeded the alarm threshold</b>
<b>Message value:</b>	-
<b>Message class:</b>	Auxiliary unit faulted (20)
<b>Drive object:</b>	B_INF, VECTOR_G
<b>Component:</b>	None
<b>Reaction:</b>	NONE
<b>Acknowledge:</b>	NONE
<b>Cause:</b>	The cooling liquid intake temperature has exceeded the specified alarm threshold. Note: The value for the alarm threshold depends on the power unit (hardware description data, e.g. 42 ... 50 °C).
<b>Remedy:</b>	Check the cooling system and the ambient conditions.

<b>F49200</b>	<b>Excitation group signal fault</b>
<b>Message value:</b>	%1
<b>Message class:</b>	General drive fault (19)
<b>Drive object:</b>	VECTOR_G
<b>Component:</b>	None
<b>Reaction:</b>	OFF2
<b>Acknowledge:</b>	IMMEDIATELY
<b>Cause:</b>	The excitation sequence control signals a fault. Fault value (r0949, interpret hexadecimal): Bit 0: When switched off or when switching off the excitation, the signal "excitation ready feedback signal" was not received within the monitoring time. Bit 1: After an ON command, the signal "excitation ready feedback signal" was not received within the monitoring time. Bit 2: After the pulses were enabled, the signal "excitation operational feedback signal" was not received within the monitoring time.

## 4 Faults and alarms

### 4.2 List of faults and alarms

Bit 3:

The "excitation group signal fault" signal is present.

Bit 4:

The switch-on command for the excitation was reset, although pulse enable (r0899.11) is still available, or the excitation current actual value has still not fallen below a minimum value.

Note:

This signal can be generated via p6500[59].

**Remedy:**

- check the excitation.
- check commands, feedback signals and BICO interconnections.
- re bit 4: increase the switch-off delay time (p1647).

#### **A49201 (F)      Excitation group signal alarm**

**Message value:** -

**Message class:** General drive fault (19)

**Drive object:** VECTOR\_G

**Component:** None

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The "excitation group signal alarm" signal is present.

Note:

This signal can be generated via p6500[58].

**Remedy:**

Check the excitation equipment.

Reaction upon F: NONE

Acknowl. upon F: IMMEDIATELY

#### **A49204 (N)      Excitation switch-off alarm**

**Message value:** -

**Message class:** Hardware/software error (1)

**Drive object:** VECTOR\_G

**Component:** Control Unit (CU)

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When switching off the excitation, after the delay time (p1647) has expired, the excitation current has still not decayed to zero.

**Remedy:**

Extend the switch-off delay time in (p1647).

Note:

The alarm is automatically reset after adapting p1647.

#### **A49205      Excitation alarm incorrect/incomplete parameterization of the brushless exciter**

**Message value:** Parameter: %1

**Message class:** General drive fault (19)

**Drive object:** VECTOR\_G

**Component:** Control Unit (CU)

**Propagation:** GLOBAL

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The brushless exciter has not been completely parameterized. The speed-dependent ratio cannot be calculated. As a consequence, it is assumed to be 1.

Additional information: parameter number that is assigned an illegal value.

See also: p0699 (Excitation configuration)

**Remedy:**

Assign the displayed parameter a value <> 0.

**A49998 Recorder trigger event occurred**

**Message value:** %1  
**Message class:** Hardware/software error (1)  
**Drive object:** B\_INF, VECTOR\_G  
**Component:** None **Propagation:** GLOBAL  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A recorder trigger event has occurred. The data are then written to the memory card, specifying the event number.  
 Alarm value (r2124, interpret decimal):  
 Event number.  
**Remedy:** Not necessary.  
 This message disappears automatically.

### Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

---

Abbreviation	Derivation of abbreviation	Significance
<b>A</b>		
A...	Alarm	Warning
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American coding standard for the exchange of information
AS-i	AS-Interface (Actuator Sensor Interface)	AS-Interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
AVS	Active Vibration Suppression	Active load vibration damping
<b>B</b>		
BB	Betriebsbedingung	Operation condition
BERO	-	Contactless proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
<b>C</b>		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system
CBC	Communication Board CAN	Communication Board CAN
CBE	Communication Board Ethernet	PROFINET communication module (Ethernet)
CD	Compact Disc	Compact disc
CDS	Command Data Set	Command data set
CF Card	CompactFlash Card	CompactFlash card

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
CI	Connector Input	Connector input
CLC	Clearance Control	Clearance control
CNC	Computerized Numerical Control	Computer-supported numerical control
CO	Connector Output	Connector output
CO/BO	Connector Output/Binector Output	Connector output/Binector output
COB ID	CAN Object Identification	CAN object identification
CoL	Certificate of License	Certificate of License
COM	Common contact of a changeover relay	Center contact of a changeover contact
COMM	Commissioning	Startup
CP	Communication Processor	Communication processor
CPU	Central Processing Unit	Central processing unit
CRC	Cyclic Redundancy Check	Cyclic redundancy check
CSM	Control Supply Module	Control Supply Module
CU	Control Unit	Control Unit
CUA	Control Unit Adapter	Control Unit Adapter
CUD	Control Unit DC	Control Unit DC
<b>D</b>		
DAC	Digital Analog Converter	Digital analog converter
DC	Direct Current	DC current
DCB	Drive Control Block	Drive Control Block
DCBRK	DC Brake	DC braking
DCC	Drive Control Chart	Drive Control Chart
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDC	Dynamic Drive Control	Dynamic Drive Control
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input/Digital Output	Digital input/output, bidirectional
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed I/O
DPRAM	Dual Ported Random Access Memory	Dual-Port Random Access Memory
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic Random Access Memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
DSM	Doppelsubmodul	Double submodule
DTC	Digital Time Clock	Timer

Abbreviation	Derivation of abbreviation	Significance
<b>E</b>		
EASC	External Armature Short-Circuit	External armature short-circuit
EDS	Encoder Data Set	Encoder data set
EEPROM	Electrically Erasable Programmable Read-Only Memory	Electrically Erasable Programmable Read-Only-Memory
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatically sensitive devices
ELCB	Earth Leakage Circuit Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder-Data-Interface	Encoder interface
EP	Enable Pulses	Pulse enable
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering system
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Elektrostatisch gefährdete Baugruppen
ESM	Essential Service Mode	Essential service mode
ESR	Extended Stop and Retract	Extended stop and retract
<b>F</b>		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBLOCKS	Free Blocks	Free function blocks
FCC	Function Control Chart	Function Control Chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Failsafe Digital Input	Fail-safe digital input
F-DO	Failsafe Digital Output	Fail-safe digital output
FEEPROM	Flash-EEPROM	Non-volatile write and read memory
FG	Function Generator	Function generator
FI	-	Fault current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field Programmable Gate Array
FW	Firmware	Firmware
<b>G</b>		
GB	Gigabyte	Gigabyte
GC	Global Control	Global control telegram (broadcast telegram)
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as M)

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
GSD	Gerätstammdatei	Generic Station Description: Describes the features of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate supply voltage
GUID	Globally Unique Identifier	Globally Unique Identifier
<b>H</b>		
HF	High frequency	High frequency
HFD	Hochfrequenzdrossel	Radio frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear actuator
HLG	Hochlaufgeber	Ramp-function generator
HM	Hydraulic Module	Hydraulic Module
HMI	Human Machine Interface	Human Machine Interface
HTL	High-Threshold Logic	Logic with high interference threshold
HW	Hardware	Hardware
<b>I</b>		
i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Startup
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
<b>J</b>		
JOG	Jogging	Jogging
<b>K</b>		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-how protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor
<b>L</b>		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
<b>M</b>		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
<b>N</b>		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization association in USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NTP	Network Time Protocol	Standard for synchronization of the time of day
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory

Abbreviation	Derivation of abbreviation	Significance
<b>O</b>		
OA	Open Architecture	Software component which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware as of which the OA-application can be used
OASP	Open Architecture Support Package	Expands the STARTER commissioning tool by the corresponding OA-application
OC	Operating Condition	Operation condition
OCC	One Cable Connection	One-cable technology
OEM	Original Equipment Manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
<b>P</b>		
p...	-	Adjustable parameters
P1	Processor 1	Processor 1
P2	Processor 2	Processor 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDC	Precision Drive Control	Precision Drive Control
PDS	Power unit Data Set	Power unit data set
PDS	Power Drive System	Drive system
PE	Protective Earth	Protective ground
PELV	Protective Extra Low Voltage	Safety extra-low voltage
PFH	Probability of dangerous failure per hour	Probability of dangerous failure per hour
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PM	Power Module	Power Module
PMI	Power Module Interface	Power Module Interface
PMSM	Permanent-magnet synchronous motor	Permanent-magnet synchronous motor
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point to Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PT1000	-	Temperature sensor
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point To Point	Point-to-point

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
<b>Q</b>		
<b>R</b>		
r...	-	Display parameters (read only)
RAM	Random Access Memory	Memory for reading and writing
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
REL	Reluctance motor textile	Reluctance motor textile
RESM	Reluctance synchronous motor	Synchronous reluctance motor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for a cable-connected serial data transmission between a transmitter and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of transmitters and receivers, also known as EIA485)
RTC	Real Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space-vector approximation
<b>S</b>		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SCC	Safety Control Channel	Safety Control Channel
SCSE	Single Channel Safety Encoder	Single-channel safety encoder
SD Card	SecureDigital Card	Secure digital memory card
SDC	Standard Drive Control	Standard Drive Control
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
SESM	Separately-excited synchronous motor	Separately excited synchronous motor
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe stop
SI	Safety Integrated	Safety Integrated
SIC	Safety Info Channel	Safety Info Channel
SIL	Safety Integrity Level	Safety integrity level
SITOP	-	Siemens power supply system
SLA	Safely-Limited Acceleration	Safety limited acceleration
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely-limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Sensorless vector control
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	SINAMICS Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe Stop 1 (time-monitored, ramp-monitored)
SS1E	Safe Stop 1 External	Safe Stop 1 with external stop
SS2	Safe Stop 2	Safe Stop 2
SS2E	Safe Stop 2 External	Safe Stop 2 with external stop
SSI	Synchronous Serial Interface	Synchronous serial interface
SSL	Secure Sockets Layer	Encryption protocol for secure data transfer (new TLS)
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
<b>T</b>		
TB	Terminal Board	Terminal Board
TEC	Technology Extension	Software component which is installed as an additional technology package and which expands the functionality of SINAMICS (previously OA-application)

<b>Abbreviation</b>	<b>Derivation of abbreviation</b>	<b>Significance</b>
TIA	Totally Integrated Automation	Totally Integrated Automation
TLS	Transport Layer Security	Encryption protocol for secure data transfer (previously SSL)
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral time
TPDO	Transmit Process Data Object	Transmit Process Data Object
TSN	Time-Sensitive Networking	Time-Sensitive Networking
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor Logic	Transistor-transistor logic
Tv	-	Rate time
<b>U</b>		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
<b>V</b>		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage negative
VdcP	-	Partial DC-link voltage positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
<b>W</b>		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
<b>X</b>		
XML	Extensible Markup Language	Extensible markup language (standard language for Web publishing and document management)
<b>Y</b>		
<b>Z</b>		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status word
