Description: Sets the gradient for the additional, fast frequency droop.

The reference quantity is the gradient for the regular frequency droop (p5407).

The settings for the regular frequency droop (p5405 onwards) apply to the other droop parameters.

As a result of the short smoothing time, the supplementary frequency droop acts similar to a D component – and therefore as damping factor for the closed-loop line control.

Recommendation: Typical setting values lie between 50 % and 100 %.

Dependency: Refer to: p5414, p5476

Note: For example, a strong frequency dip can be generated when the load is connected with the additional frequency droop, and this can be used to emulate the behavior of a diesel generator.

The frequency is initially changed with the smoothing time p5414 in accordance with the additional droop, reaching the stationary end value in accordance with the time constant p5409 for the regular frequency droop.

The additional droop is deactivated with p5413 = 0.

Description: Sets the no-load voltage for the voltage droop and grid droop control.

This value is entered as a % referred to the device supply voltage (p0210)

Using the voltage droop, the currently required output voltage can be calculated for stable grid operation.

The no-load voltage is defined as the setpoint output voltage for the case that the reactive current or the reactive power at the selected connection point (p5403, p5404) assumes a value of 0.

Dependency: Refer to: p5419

Note: For the reactive current voltage droop (p5400.0 = 0), the following applies:

The droop characteristic input variable is the reactive power r5421[0] at the selected connection point (p5403, p5404).

The following droop formula applies without taking into account smoothing:

r5420 = (p5415 + p5416 + p5417 * r5421[0] / r0207) * p0210

The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.

For the reactive power voltage droop (p5400.0 = 1), the following applies:

The input variable of the droop characteristic is the reactive power (r5422[0]) at the selected connection point (p5403, p5404).

The following droop formula applies without taking into account smoothing:

p5420 = (p5415 + p5416 - p5417 * r5422[0] / (1.732 * r0207 * p0210)) * p0210

The voltage calculated according to this formula, after smoothing (p5419) is effective as output voltage and is indicated in r5420.

[1] = Supplementary setpoint direct

Dependency: Refer to: p5415

Notice: For index [1]:

Setpoint steps without smoothing can result in significant equalization operations in the line supply and the overload of the inverter and the line components.

Note: For index [0]:

The setpoint signals are PT1-filtered with the time constant p5419.

For index [1]:

If the signals for the unsmoothed setpoints are precisely reset to 0 (e.g. for p5483[3] = 1), then by internally adapting the smoothed setpoint state, an undesirable step-like voltage change is avoided. The signal for the smoothed setpoint should be adapted using a corresponding voltage change, if the output voltage is to be kept constant.

The gradient is the required voltage change for a reactive current having the same magnitude as the rated current (r0207).

For the reactive power voltage droop (p5400.0 = 1), the following applies:

The gradient is the required voltage change for the reactive power, which is obtained at rated voltage and rated current (1.732 * p0210 * r0207).

Description: Sets the parameters for rapid precontrol of the output voltage in the event of a voltage dip.

The values relate to the voltage setpoint from the voltage droop (r5420).

The voltage output by the converter is formed from the product of the voltage setpoint and the adaptation factor, which is calculated in rapid precontrol.

Index:
[0] = Adaptation factor lower limit
[1] = Adaptation factor increment current limit
[2] = Adaptation factor increment voltage difference
[3] = Adaptation factor increment increase

Dependency: Refer to: r5452

Note: Rapid adaptation of the voltage setpoint to a reduced line voltage (e.g. in the event of a line short circuit) reduces the number of additional switching operations completed by the lower-level rapid current hysteresis controller.

For index [0]:

Minimum value for the adaptation factor, must be complied with for the calculation of the reduced output voltage. The factory setting is appropriate if the inductance of the commutating reactor (p0223) has the value p3421 - p3424.

Higher values for p5428[0] result in higher rms values of the currents in the case of a short circuit. However, current limiting also intervenes more – and more harmonics are generated.

For excessively low values in p5428[0], the short-circuit displayed in r5479[1] is no longer reached.

The function is deactivated with p5428[0] = 100 %.

For index [1]:

When the current limit is reached, the adaptation factor is weighted with this factor in each sampling cycle. A value of 0 means that the adaptation factor will jump to the minimum value (p5428[0]) if the current limit is reached. The function is deactivated for a value of 100%.

For index [2]:

If the voltage across the line reactor exceeds the minimum value (p5428[0]) for at least 2 current controller sampling times, the adaptation factor will be weighted with this factor (p5428[2]) in every sampling cycle.

For index [3]:

If none of the above criteria for reducing the adaptation factor is met, the adaptation factor is increased by the percentage value p5428[3] in each current controller sampling time (the increase is additive). If the adaptation factor reaches the maximum value of 100%, the effect of precontrol by means of multiplication by the droop setpoint r5420 is cancelled out.

Description: Sets the gain for the DT1 element of the frequency droop.

In addition or alternatively to fast droop (p5413, p5414), with this D component power oscillations in the island line can be dampened.

The reference quantity is the gain of the regular frequency droop (p5407).

Recommendation: Typical setting values lie between 50 % and 100 %.

Dependency: Refer to: p5477

Note: With p5476 = 100 %, a frequency change from the power-frequency droop, unscaled for the integration of the line angle becomes effective.

With p5476 = 0, damping of the line control via the DT1 element is deactivated.

The reference quantity is the smoothing time for the regular frequency droop (p5409).

Recommendation: Typical setting values lie between 100 % and 200 %.

Dependency: Refer to: p5476

Note: With a lower smoothing time, the corner frequency of the high pass filter formed by the DT1 element increases. To dampen resonance in the line, the corner frequency must lie below the resonant frequency, and the setting value for the smoothing time must be selected to be correspondingly high.

Description: Sets the mode for the transformer magnetization.

Using this function, a transformer is magnetized using a voltage that is in synchronism with the external line supply; this means that no inrush currents flow when this transformer is connected to the line supply.

If value = 11:

Automatic determination of the magnetizing inductance.

The magnetizing inductance determined in r5491 must be transferred to p5492 in order to take effect.

Observe notes regarding r5491.

If value = 12:

Automatic determination of the transformer phase shift and the gain correction.

The transformer phase shift determined in r6440 must be transferred to p6420 in order to take effect.

The gain correction determined in r6441 must be transferred to p6421 in order to take effect.

If value = 13:

Determination of the total leakage inductance of the transformer during line data identification. p3410 = 1 is set automatically and the inductance is measured on the next switch-on. Once the measurement has been completed the converter shuts down automatically and p3410 is set = 0 and p5480 is set = 1.

The total leakage inductance of the transformer determined in r5489 must be transferred to p5490 in order to take effect.

If value = 101:

The infeed goes into line droop control, however the main switch/circuit breaker is not closed, and the transformer magnetization remains in the state r5482 = 4.

Test operation requires the "Line droop control" function module to be activated (r0108.12 = 1).

If value = 102:

As for test operation 1.

However, synchronization with the line is not realized (VSM2 measured data r5460 and following is not used); instead, the output voltage is generated corresponding to the rated data p0210, p0211, p5486.

12: Identification transformer phase shift/gain correction
13: Identification total transformer leakage inductance
101: Test operation 1 (without activation of circuit breaker)

Dependency: Refer to: r5482, p5486, r5493, p5494, r5499, p5580

Notice: The feedback signal contact of the circuit breaker between the Active Interface Module and the island grid must be connected in parallel via binector input p0860.

For an active black start (p5580 > 0), a separate transformer magnetization is not performed.

Note: The transformer magnetizing function is used in order to magnetize a line transformer to which the Active Line Module (ALM) is connected.

The precondition is that the transformer can be isolated from the line supply on the primary side using a circuit breaker and that the DC link of the ALM is supplied from a separate power source before the circuit breaker is closed (e.g. with a separate precharging transformer or for photovoltaic applications).

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1

The status of the transformer magnetization, black start and island grid synchronization is displayed in r5499.

The status of the sequence control for transformer magnetization, black start and island grid synchronization is displayed in r5482.

If value = 13:

For weak line supplies, it is recommended to reduce the excitation current p3415 for identifying the inductance (e.g. p3415[0] = p3415[1] = 5 %).

Note: For index [0]:

Setting the rated primary voltage of the line transformer, at whose secondary the AIM and the ALM are connected.

If there is a circuit breaker at the transformer primary side, then the transformer can be magnetized before closing this circuit breaker in order to avoid high inrush currents.

The setting of this primary voltage and setting the device supply voltage (p0210) defines the transformer ratio.

To magnetize the transformer, the voltage has to be measured at the line side of the circuit breaker. To do this, an additional VSM must be connected and parameterized using p0150[0] and following. The voltage actual values of this VSM are displayed in r5461[0] and r5462[0]. The voltages converted over to the transformer secondary side are displayed in r5488[0, 1, 2].

Setting the rated primary voltage of the line transformer; an island grid with ALM in the grid droop mode (p5401) is connected to the secondary of this transformer. Typically, the transformer primary is connected to the grid or to another island grid through a circuit breaker.

The setting of this primary voltage and setting the device supply voltage (p0210) defines the island grid transformer ratio.

To synchronize the island grid voltage with the external grid, the external grid voltage must be measured. To do this, an additional VSM must be connected and parameterized using p0150[1] and following. The voltage actual values of this VSM are displayed in r5461[1] and r5462[1]. The voltages converted over to the transformer secondary side can be displayed in r5488[3, 4, 5]. Description: Displays the magnetizing inductance of the supply transformer determined using the identification (p5480 = 11).

The result of the identification must be entered into p5492.

Dependency: Refer to: p5480, p5492

Notice: Overmodulation (r0074 > 97 %) during the measurement as a result of an excessively low DC link voltage, can have a significant influence on the measurement result. A countermeasure, for example, can be to reduce the output voltage using p5494.

The measurement result depends very strongly on precisely specifying the filter capacitance (p0221).

When filter monitoring is active (p3678 > 0), the current measured values of the VSM (r3671, r3672) are used to identify the magnetizing inductance. Incorrect VSM measured values result in excessively high deviations when determining the magnetizing inductance.

Note: During identification, the value previously entered in p5492 is not effective.

The display value is reset to 0 at POWER ON.

Description: Sets the magnetizing inductance of the supply transformer.

Dependency: Refer to: r5491

Notice: If possible, p5492 should be set based on the data on the transformer rating plate.

If the magnetizing inductance is not specified, then an estimate can be made using the formula specified below (instead of r0206, the transformer rated power is used).

The magnetizing inductance should be used as basis for setting the DC component controller (p5437).

Note: The parameter is preset when selecting the power unit (p0201). In so doing, a transformer is assumed with the same power and with 2 % magnetizing current:

p5492 = r0206[0] / (3 * r0207[0] * r0207[0] * 2 % * 2pi * p0211)

Description: Display and connector output to control the circuit breaker for transformer magnetization and island grid synchronization.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	External precharging bypass contactor	Yes	No	-
01	Island grid circuit breaker	Yes	No	-

Dependency: Refer to: r0863, r3402

Caution: For bit 01:

Without any additional control logic, the signal is not suitable to control the island grid circuit breaker.

The signal only represents an enable signal to close the circuit breaker during the actual synchronization (r5499.5 = 1). For r5499.5 = 0, generally the following applies r5493.1 = 0.

Note: For bit 00:

The signal is used to control the external bridging contactor in the precharging circuit.

The external bridging contactor is closed if precharging is complete (r3402 > 5) and the circuit breaker has not been activated (r0863.1 = 0).

For bit 01:

The signal is used to control the circuit breaker between the island grid and the external grid.

The signal is set to 1, if the island grid was successfully synchronized. In this case, the conditions for synchronization (frequency, amplitude, phase angle, p5586) are maintained.

Index: [0] = Voltage setpoint (90 - 100 %)
[1] = Current limit (150 % deactivated)

Dependency: Refer to: F06505

Note: For index [0]:

If the precharging circuit of an application only creates a low DC link voltage, which is not sufficient to fully magnetize the transformer (modulation depth r0074 limited), then the target value for the magnetization can be reduced (p5494[0]).

When closing the line contactor, the residual magnetization required only causes a relatively low recharging current surge that is generally within permissible limits.

For index [1]:

If, during transformer magnetization, the current limit is exceeded (r0068 > p5494[1] * r0207), then fault F06505 is output.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Line PLL with transformer voltage	Yes	No	-

Note: VSM: Voltage Sensing Module

For bit 00:

When the bit is set, voltages (r5488[0, 1]) from the transformer model are used as input variable for the grid PLL (r3452 and following), which otherwise operates with the measured values of VSM1 (r3661, r3662).

This means, for example if the transformer properties are not known, a higher accuracy of the PLL can be achieved, and in turn the controller stability improved.

For booksize drive units, the following applies:

Before and during PLL synchronization (r3402 <= 7), p5495.0 is only effective if operation with VSM is activated (p3400.5 = 1).

08	Grid support Q mode while FRT	Yes	No	-
09	Grid support Z mode while FRT	Yes	No	-
10	Permit active power during non-symmetrical FRT	Yes	No	-

Dependency: Refer to: p5507, r5510, p5520

Note: For bit 00:

If p5500.0 = 0 the output value of the grid support characteristic is added to the control's reactive current setpoint.

r0075 = p3610 + p3611 + r3471 + r5510[0]

If p5500.0 = 1 the dynamic reactive current setpoint p3611 is subtracted if dynamic grid support is active (p5502.1 = 1).

In this case, the following applies:

r0075 = p3610 + r3471 + r5510[0]

For bit 01:

Only active for p5500.3 = 0.

If p5500.1 = 0 the alpha and beta amplitudes of the line voltage, which were smoothed with p5507[2], are determined. The absolute value of the line voltage, calculated from these amplitudes, is used as input value for the characteristic for grid support. In the event of an asymmetrical line disturbance, oscillation of the reactive current setpoint (r5510) is prevented.

If p5500.1 = 1, the smoothed absolute value of the measured line voltage is used as the input value for the grid support characteristic. Smoothing is set with p5507[3].

For bit 02:

Only effective if p5500.1 = 0 and p5500.3 = 0.

If p5500.2 = 0, the maximum value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic. The reactive current setpoint (r5510) will, therefore, remain virtually constant even in the event of asymmetrical line disturbance. Power fluctuations in the DC link are reduced.

If p5500.2 = 1, the mean value from the alpha and beta line voltage amplitudes is used as the input value for the grid support characteristic.

For bit 03:

For p5500.3 = 0, no negative phase-sequence system current setpoint according to the characteristic is calculated. This means that the setpoints for the negative phase-sequence system current controller are also equal to 0 if the line supply is not symmetrical.

For p5500.3 = 1, for an asymmetrical line supply voltage, a negative phase-sequence system current setpoint is calculated, which counteracts the voltage asymmetry and therefore supports the grid.

The negative phase-sequence system current is impressed using the negative phase-sequence system controller (p3636 and following).

The negative phase-sequence system controller is automatically activated and deactivated (the following applies, p3640.0 = p5500.3).

For bit 04:

Only active for p5500.3 = 1.

For p5500.4 = 0, a negative phase-sequence system current setpoint according to characteristic p5505/p5506 is generated if the difference between two line phase voltage amplitudes is greater than p5509[9] - and the amplitude of at least one line phase voltage exceeds the line tolerance range according to the characteristic.

For p5500.4 = 1, an already supporting negative phase-sequence system current is impressed according to the characteristic, if only the difference between two line phase voltage amplitudes is greater than p5509[9].

For bit 05:

For p5500.5 = 1, the limiting of the support reactive current is not active according to the characteristic p5505/p5506. Instead, the current limits p5506[1] and p5506[3] are effective after adding the supplementary reactive current setpoints p3610 and p3611.

For bit 06:

For p5500.6 = 1, the apparent current is limited to the smoothed apparent current (r0027) effective at the start of an FRT. During this line fault, this value of the apparent current limit is continually effective.

For bit 07:

Only effective for p5526.7 = 1 and p192.19 = 1

For p5500.7 = 1, for each phase, a tolerance band is generated around the current setpoint, which the current actual value does not leave.

For p5500.7 = 0, a tolerance band is generated based on the current setpoint amplitude. The current actual value for each phase can be within this tolerance band.

For bit 08:

Only active for p5500.3 = 1.

For p5500.8 = 1, during a line short-circuit (r5502.4 = 1) the active line infeed current is reduced to zero.

For p5500.8 = 0, during a line short circuit (r5502.4 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For bit 09:

Only active for p5500.3 = 1.

For p5500.9 = 1, during a line short-circuit (r5502.4 = 1) the active line infeed current and the supporting reactive current are reduced to zero.

For p5500.9 = 0, the standard response of dynamic line support applies corresponding to p5500.8 = 0.

For bit 10:

Only active for p5500.3 = 1.

For p5500.10 = 1, during an asymmetrical line short circuit (r5502.2 = 1) the active line infeed current is increased within the effective current limits in order to achieve the highest possible active power. To support the line supply, the reactive current has priority over the active current.

For p5500.10 = 0, during an asymmetrical line short-circuit (r5502.2 = 1) the active line infeed current is reduced to zero.

Description: Sets the signal source to activate dynamic grid support.

BI: p5501 = 1 signal:

Activates dynamic grid support.

BI: p5501 = 0 signal:

Deactivates dynamic grid support.

Recommendation: The smoothing time for the line PLL (p3458[1]) should be set to values higher than 20 ms so as to ensure stable operation even with significant dips in supply voltage.

Dependency: For p5501[0], the following applies:

The Smart Mode must be deactivated (p3400.0 = 0) to set a signal source.

Notice: Dynamic grid support can only be activated if the power units have a gating unit with current limitation control (r0192.19 = 1 or r0192.30 = 1).

Note: If grid support has been activated:

Line disturbance will trigger grid support in accordance with the set characteristic (p5505, p5506).

If grid support is deactivated:

Line disturbance will generate the standard response to phase failures on the part of the infeed for drive applications (see A06205).

Description: Sets the time values for dynamic grid support.

Recommendation: For index [0]:

For the run-on time p5507[0], the current limits parameterized for the dynamic grid support remain valid (e.g. p5509[11]). If a grid standard specifies that the active power is re-established faster, then we recommend that the run-on time is reduced (e.g. p5507[0] = 20 ms).

Index: [0] = Minimum time dynamic grid support
[1] = Minimum time line disturbance
[2] = Smoothing time alpha/beta
[3] = Smoothing time instantaneous value
[4] = Minimum time non-symmetrical grid fault

Dependency: Refer to: p5500, p5509, p5529

Note: For index [0]:

Minimum time for continuing grid support in accordance with the characteristic once the line voltage has returned to the permissible tolerance range between the two starting points (p5505[0], p5505[2]).

For index [1]:

Minimum time for line disturbance for the start of grid support in accordance with the characteristic.

If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

For index [2]:

Smoothing time for the calculation of the alpha amplitude and the beta amplitude of the line voltage if p5500.1 = 0.

An estimated value for the actual line voltage absolute value is calculated from the alpha and beta amplitudes and serves as the input value for the grid support characteristic.

A smoothing time of less than a line period makes no sense.

If the estimated absolute value deviates from the smoothed measured voltage absolute value by more than 25%, the smoothed measured value is used. This corresponds to a temporary automatic changeover from p5500.1 = 0 to p5500.1 = 1.

For index [3]:

Smoothing time for the measured absolute value of the line voltage if p5500.1 = 1.

The smoothed absolute value of the line voltage is used as the input value for the grid support characteristic.

Setting p5507[3] = 0 deactivates smoothing.

For index [4]:

Minimum time for a non-symmetrical line disturbance for the start of grid support in accordance with the characteristic p5506 and scaling factor p5509[12].

If the tolerance band between the two characteristic starting points is violated for at least this period of time, voltage control in accordance with characteristic will start up.

The value represents an offset to the setpoint of the DC link voltage.

The following applies to the intervention threshold: p3510 + p3511 + p5508[1]

Index: [0] = Offset overvoltage
[1] = Offset setpoint voltage

Dependency: Refer to: r0297

Note: To avoid imminent shutdown due to a DC link overvoltage, the reactive current setpoint is reduced for dynamic grid support. Instead of this, the available converter current is used as the active current to reduce the DC link voltage.

Description: Sets the scaling values for dynamic grid support.

Recommendation: For index [0]:

If the reactive current setpoint increases to rapidly, at the start of a grid fault, this can result in DC link overvoltages. If possible, we then recommend p5509[0] = 5 ... 10 %.

For index [1]:

In order to guarantee that the support reactive current is kept, even when the Vdc thresholds p5508 are reached, we recommend p5509[1] = 0.1 %.

For index [7]:

If a support reactive current is also required for a non-symmetrical grid faults, then correspondingly p5509[7] must be set > 0.1 % (typically = 100 %).

For index [8]:

If a support reactive current is also required for non-symmetrical grid faults, then we recommend p5509[8] > 20 % in order to reduce Vdc oscillation.

For index [11]:

A value p5509[11] > 30 % can help avoid DC link overvoltages during grid faults.

[12] = Grid asymmetry grid support charac. reactive current scaling
[13] = Grid voltage change for fast precontrol adaptation

Dependency: Refer to: p5505, p5506, p5508

Notice: For index [5]:

For devices with r0192.19 = 0 (e.g., Active Line Module Booksize), the maximum apparent current limit can be set to p5509[5] = 80 %.

Note: For index [0]:

Change in the reactive current setpoint (% per ms) at the beginning and end of dynamic grid support.

This avoids sudden changes in the reactive current if the starting points for the line voltage (p5505[0], p5505[2]) are overshot.

For index [1]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is overshot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

The reactive current ramp is deactivated with p5509[1] = 0.1 %. The reactive current required for dynamic support is also kept, even when the Vdc threshold is reached.

For index [2]:

Change in the reactive current setpoint (% per ms) when the maximum Vdc threshold (p5508) is undershot.

To avoid beat phenomena, the following must apply: p5509[1] > p5509[2].

For index [3]:

Sets the hysteresis for the line voltage to exit grid support (as a percentage of the supply voltage p0210).

To exit grid support, the line voltage must be in the interval reduced by the hysteresis width (the interval is defined with the starting points p5505[0] and p5505[2] and the hysteresis width p5509[3]).

For index [4]:

Sets the scaling factor for the reference voltage for dynamic grid support (as a percentage of the supply voltage p0210).

As a result, the product of p0210 x p5509[4] is applied as the voltage zero.

For index [5]:

Sets the scaling factor for the permissible maximum converter current absolute value for dynamic grid support (as a percentage of the converter maximum current r0209).

Values higher than 100% will not be applied.

Values greater than 80 % can only be set, if the duration that can be set is less than or equal to 3 seconds for the short-circuit state p5528.

For Active Line Module Booksize, the setting value is limited to 80 %.

This value (independent of the grid voltage) is active if the "Dynamic grid support" function is active (p5501 = 1 signal)

For index [6]:

Only active for p5500.3 = 1.

Sets the percentage voltage change (as a percentage of p0210) from which value the calculated positive phase-sequence system and negative phase-sequence system amplitudes are quickly adapted. As a consequence, the grid is quickly supported when step-type faults occur.

For index [7]:

Only active for p5500.3 = 1.

Sets the maximum positive phase-sequence system reactive current absolute value to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

If a symmetrical support reactive current (positive phase-sequence system current), is also specified for non-symmetrical grid faults, then generally, p5509[7] should be set to = 100 %.

For index [8]:

Only active for p5500.3 = 1.

Sets the maximum negative phase-sequence system absolute current to support the grid in the case of line asymmetry (r5502.2 = 1) as a percentage of r0207.

For the case p5509[7] = 100 %, we recommend setting p5509[8] > 20 %.

For index [9]:

Only active for p5500.3 = 1.

Sets the minimum value of the voltage asymmetry to impress a negative phase-sequence system current for asymmetrical grid support.

For p5500.4 = 1, a negative phase-sequence system current is already impressed, if the voltage asymmetry exceeds the set value.

For p5500.4 = 0, in addition, for at least one of the phase voltages, the tolerance condition from the characteristic p5505 / p5506 must be exceeded.

For index [10]:

Only active for p5500.3 = 1.

Sets the maximum value of the voltage asymmetry to end asymmetrical grid support.

This means that parameters p5509[9] and p5509[10] define a hysteresis range.

For index [11]:

Only active for p5500.3 = 1.

Sets the scaling factor for the permissible negative active current value for dynamic grid support (as a percentage of the converter maximum current r0209).

For index [12]:

Only active for p5500.3 = 1.

Sets the scaling factor for dynamic grid support for 2-phase grid dips. The gradient of the support characteristic p5505/p5506 is scaled using this factor if asymmetry (r5502.2=1) is present. The setting of p5509[0] is applicable for the transition ramp

For index [13]:

Only active for p5500.3 = 1.

If the grid voltage dips by this voltage with respect to the value of p0210, then the voltage precontrol is quickly adapted based on the calculated positive phase-sequence system and negative phase-sequence system amplitudes.

Dependency: Refer to: r5522

Note: For index [0...3]:

Sets the limits for the state change of the current hysteresis controller.

The current value refers to r0209.

The voltage value refers to p0210.

For index [4]:

Sets the voltage change that defines the "Grid return" event (as a percentage of p0210).

For index [5]:

Sets the current change that defines the "Grid return" event (as a percentage of p0207).

For index [6]:

Sets a scaling factor to identify grid return to increase the degree of ruggedness.

For index [7]:

Sets the precontrol value for the step-like (fast) adaptation of the output voltage when identifying a fast grid recovery (as a percentage of von p0210).

Description: Sets the configuration for line monitoring.

Line monitoring is activated using binector input p5541 = 1 signal.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Voltage and frequency monitoring	Yes	No	-
01	AISL frequency shift technique	Yes	No	-
04	FRT voltage time characteristic	Yes	No	7999
05	FRT shutdown delayed	Yes	No	7999
07	FRT frequency-time characteristic	Yes	No	7999
09	Line synchronization voltage/frequency check	Yes	No	-
10	FRT time characteristic separate initiation	Yes	No	-

Dependency: Refer to: p5541

Refer to: F06851

Notice: For bit 00:

Fault F06851 is additionally displayed if, as a result of a line voltage fault, the current control was inhibited (alarm A06205, r03405.2 = 1) - and the inhibit is continuously active while the wait time is elapsing (p5545[0]). To make reference to the temporarily active alarm A06205, fault F06200 is subsequently output.

Note: AISL: Anti Islanding

FRT: Fault Ride Through (riding through a grid fault)

HFRT: High Frequency Ride Through (riding through frequency increases)

HVRT: High Voltage Ride Through (riding through voltage increases)

LFRT: Low Frequency Ride Through (riding through frequency dips)

LVRT: Low Voltage Ride Through (riding through voltage dips)

For bit 00:

The monitoring thresholds of the voltage and frequency criterion are defined using p5543 and p5544. If these thresholds are violated, then this is flagged in status word r5542 bits 6 to 9. If the violation remains during wait time p5545[0], then fault F06851 is output.

For bit 01:

The frequency shift technique actively changes the frequency that is fed in. For islanding formation this results in the permissible frequency bandwidth being violated. Shut down is realized via fault F06851.

For bit 04:

It is only possible to activate the FRT voltage-time characteristic (HVRT, LVRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5543 are deactivated. The voltage-time monitoring to be set using p5550 to p5554 applies (display in r5542 bits 10 and 11).

For bit 05:

Sets the response after a voltage dip (LVRT).

0 = immediate shutdown.

1 = shutdown only after the time in p5545[2] has expired.

For bit 07:

It is only possible to activate the FRT frequency-time characteristic (HFRT, LFRT) when the voltage and frequency monitoring are activated (p5540.0 = 1). The monitoring thresholds p5544 are deactivated. The frequency-time monitoring to be set using p5555 to p5559 applies (display in r5542 bits 12 and 13).

For bit 09:

The additional voltage and frequency check is activated when switching on. To do this, before operation is enabled, a check is made against the limits p5543[2, 3] and p5544[2, 3], and the system waits until these limits are maintained (r3402 = 7 or r3402 = 12 when transformer magnetization is active (p5480 > 0)).

If the voltage and frequency limits are violated, then this is indicated in status word r5542 bits 6 to 9.

For bit 10 (only effective for p5540.4 = 1 or p5540.7 = 1):

0 = when the overvoltage or undervoltage limit is violated (p5550[0, 1]), both curves (overvoltage and undervoltage curve) always start at the same time. Correspondingly applies for the frequency-time characteristics.

1 = activation of separate initiation of FRT voltage-time characteristics for an overvoltage or undervoltage event. Correspondingly applies for the frequency-time characteristics.

The following interconnection is practical for synchronizing an island grid to another grid (typically: public grid):

- the voltage of the island grid is measured using a VSM (r5461[0] and r5462[0]), which is connected in front of the circuit breaker between the island grid and the ALM.

- the voltage of the external grid is measured using another VSM (r5461[1] and r5462[1]), which is connected in front of the circuit breaker between the external grid and the island grid. The voltages (r5488[3, 4]) transformed to the ALM supply voltage are used as input variables for the PLL2.

Description: Sets the mode for the black start.

An island grid, which at the start has no voltage, can be established using this function. In this case, the ALM acts as the grid voltage source or as grid generator for the connected island grid.

Prerequisite:

Activating function module "Line droop control" (r0108.12 = 1) and line droop operation (p5401).

If value = 0:

The black start is deactivated.

If value = 2:

At the next switch on, a black start is carried out. Here, the precondition is that the line voltage is close to zero (less than p5586[0]). Using the grid droop control, the grid voltage is increased up to the rated value using a ramp function.

If value = 3:

At the next switch on, a black start is carried out if the grid voltage is less than p5586[0]. If on the other hand, a grid is connected within the regular tolerances (p0281, p0282), then a regular switching-on operation is carried out with synchronization to the existing grid voltage.

If, in so doing, transformer magnetization is activated (p5480 = 1), then this is performed.

Value:
0: Deactivated
2: Grid black start completed
3: Grid black start automatic

Notice: A black start is only possible when the grid droop control (p5401) is activated.

A black start is only possible when the transformer test operation mode is deactivated (p5480 <= 1).

The use of feedback signal contacts from the circuit breaker between the Active Interface Module and the island grid is urgently recommended (p0860).

Note: Precondition for establishing a voltage in an island grid is that adequate power is supplied into the ALM DC link (e.g. generator, photovoltaic) as well as control of the DC link voltage using this power generation system. The power requirement of the Island grid must not exceed the power of the generating system - even briefly.

In order to avoid the high inrush currents,when the grid is being established, the voltage is ramped up to the rated value. At the end of the voltage ramp, the system changes over into regular grid droop operation. The ALM then operates as grid-generating voltage source using active and reactive power droop, also with other sources of power in the island grid, in a stable fashion. The other power units can then act as a current source to support the grid or as a voltage source to form a grid. As grid forming unit, then the other power units must also have a grid droop function.

The circuit breaker between the Active Interface Module and the island grid is controlled via binector output r0863.1 Before closing this switch, it is checked as to whether the island grid is in a non-voltage condition. A possibly existing residual voltage in the Active Interface Module is automatically controlled down to zero.

Index:
[0] = Setpoint ramp frequency
[1] = Setpoint ramp voltage

Notice: In order to avoid equalization operations, after island synchronization has been completed, it is not permissible that supplementary setpoints for frequency and voltage are suddenly set to zero (as step function). This is the reason that after ending synchronization, the setpoints are held constant and reset with the trigger signal p5583[2] = 1.

In the same controller cycle, the signals for smoothed frequency (p5406[0]) and voltage (p5416[0]) are corrected by the corresponding absolute values!

The supplementary setpoints (r5582) are automatically reset when synchronization is canceled and when the grid droop (p5401) is deactivated with a change into regular closed-loop current control operation (with adaptation to the grid frequency).

Note: In the default setting, the setpoints are connected with the unfiltered setpoint inputs (no-load frequency p5406[1], no-load voltage p5416[1]) of the grid droop. While synchronizing the island grid to an external grid, the amplitude, phase angle as well as the frequency of the island grid are adapted in this fashion.

The setpoints for synchronizing can also be used for synchronous voltage and frequency adaptation of additional power generating systems in the island grid.

Description: Sets the signal sources for island grid synchronization.

Using the island grid synchronization function, an island grid can be synchronized with an external grid regarding frequency, phase angle and voltage amplitude.

After synchronization has been performed, a circuit breaker between the two grids can be closed (r5493.1).

Index:

Notice: For index [1]:

The feedback signal contact of the circuit breaker between the external grid and the island grid (in front of the grid transformer) must be connected in parallel via binector input p5583[1].

The feedback signal is required for a state change in the synchronization sequence control. This signal is not used to completely monitor the contactor (p0860 and following).

Note: In order to synchronize an island grid with an external grid, frequency, phase position and amplitude of the island grid must be changed in operation!

This assumes that the components of the island grid are suitable for these parameter changes and that the ALM is the only grid generator in the island grid.

Note: For index [0]:

Sets the duration of the asymmetrical voltage output. After reaching the set duration, the asymmetry is exited and the regular symmetrical grid voltage droop becomes active again. To start an additional voltage asymmetry, a 0/1 edge of the activation signal p5591 is first required.

With p5588[0] = 0, the asymmetry set with p5590 is active without any time limit (up until it is deactivated with p5591 = 0).

For index [1]:

Sets the duration of an initial ramp at the start of the asymmetrical voltage output.

When required, with a ramp, overvoltages in systems that are capable of oscillation can be prevented.

The ramp starts as soon as the trigger condition according to p5589 is fulfilled.

During the ramp, the voltage output is changed step-by-step from the regular symmetrical rotating voltage vector into the asymmetry set using p5590.

The ramp is part of the duration of the asymmetrical voltage output set using p5588[0].

With p5588[1] = 0, the ramp is deactivated and the voltage is immediately changed (step function) to the set asymmetry (p5590).

For index [2]:

During the ramp, the voltage output is changed step-by-step from the asymmetry set using p5590 to the regular symmetrical rotating voltage vector.

With p5588[2] = 0, the ramp is deactivated and the voltage is immediately changed (step function) to the set asymmetry (p5590).

Description: Sets the trigger angle for the asymmetrical voltage output.

Dependency: Refer to: p5590, p5591

Notice: The set angular values cannot be precisely implemented, but only rounded off to interval limits corresponding to the current controller sampling time (p0115[0]).

Example:

With p0115[0] = 0.25 ms and a 50 Hz line frequency, an angular resolution of 0.25 ms * 50 Hz * 360 ° = 4.5 ° is obtained.

Note: The function is activated using binector input p5591 = 0/1 signal.

After this function is activated, the start of asymmetry is delayed until the phase angle (r5412) reaches the value of p5589. This means that asymmetrical voltage changes can be implemented, which can be synchronized with the basic fundamental of the grid voltage - and that are reproducible.

With p5589 < 0 °, asymmetry starts immediately with the 0/1 edge, and is therefore not synchronized with the grid voltage.

Description: Sets the signal sources for scaling the individual phase and line voltages.

This therefore allows asymmetrical voltage sources to be implemented (negative phase-sequence system voltage not equal to 0).

The scaling of phase and line voltages can be freely combined.

As a result of the 3-conductor connection, using the power unit, a zero system cannot be implemented as a result of the inherent operating principle. As a consequence, the sum of the output voltages is always 0.

We recommend that p5594 is used for simple handling based on fixed values.

[4] = Phase voltage factor S
[5] = Phase voltage factor T
[6] = Zero system voltage factor R0
[7] = Zero system voltage factor S0
[8] = Zero system voltage factor T0

Dependency: Refer to: p5415, p5416, p5594

Danger: By scaling the phase voltages, phase short-circuits as well as overcontrol of the phase voltages (with overvoltages and high harmonic components) can be realized.

This means that special care must be taken when using this function.

The complete system with all of the connected components must be designed for the resulting current and voltage levels in order to rule out injury and material damage.

Notice: The voltage control of the grid droop (p5429) uses the symmetrical basic fundamental amplitude (positive phase-sequence system voltage) as control variable. Changing an individual phase voltage therefore results in an undesirable subsequent control of the positive phase sequences system voltage.

In the case of an asymmetrical setpoint voltage due to p5590, we therefore recommend that p5426 = p5427 are set = 0.

For the same reason, generally the modulation depth controller (r5433) must be deactivated.

The setting value of indices 6, 7 and 8 together must add up to 300% in order to ensure that the zero system is completely subdivided. Otherwise, a remaining zero system is automatically distributed internally and symmetrically across all 3 phases.

Note: Using the grid droop function (p5415, p5416), depending on the reactive current actual value, a voltage amplitude is calculated for all 3 grid phases (positive phase-sequence system voltage, r5429). The amplitude of the individual grid phases is obtained by multiplying this positive phase-sequence system voltage by the associated scaling factors p5590[...]. The DC component control (p5436), the harmonic control (p5440) and the interventions when reaching the current limits (p5478) remain active, also for asymmetrical setpoint voltages.

The setting p5590[...] = 1 deactivates the corresponding scaling (as a consequence, internally a value of 100% is active).

For index [0, 1, 2]:

Virtual three-phase voltage source in a delta connection.

Internally, the values are limited to the range 0 ... 100%.

Setpoint voltage amplitude phase RS: U_RS = r5429 * root(2) * p5590[0]

Setpoint voltage amplitude phase ST: U_ST = r5429 * root(2) * p5590[1]

Setpoint voltage amplitude phase TR: U_TR = r5429 * root(2) * p5590[2]

The instantaneous voltages are internally adapted using a transformation matrix so that a zero system-free three-phase voltage system is obtained. For example, a short circuit between phases R and S can be directly emulated using p5590[0].

For index [3, 4, 5]:

Virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range 0 ... 150%.

Setpoint voltage amplitude phase R: U_R = r5429 * root(2/3) * p5590[3]

Setpoint voltage amplitude phase S: U_S = r5429 * root(2/3) * p5590[4]

Setpoint voltage amplitude phase T: U_T = r5429 * root(2/3) * p5590[5]

As the sum of the 3 sinusoidal voltages must be 0 at any particular instant in time, the average value of the instantaneous voltages are subtracted in each phase (i.e. the zero system components are evenly distributed across the 3 branches). For example, this is the reason that p5590[3] = 0% does not result in a DC voltage of 0 in phase R.

For index [6, 7, 8]:

Zero system distribution of the virtual three-phase voltage source in a star connection.

Internally, the values are limited to the range -300 ... 300 %.

Using these factors, it is defined with which component an existing zero system (instantaneous value u0 = (u_R + u_S + u_T)/3) should be subtracted in the individual phases.

Zero system correction phase R: u1_R = u_R - u0 * p5590[6]

Zero system correction phase S: u1_S = u_S - u0 * p5590[7]

Zero system correction phase T: u1_T = u_T - u0 * p5590[8]

In order to obtain a zero system-free U1 system, p5590[6] + p5590[7] + p5590[8] must = 300%. If this condition is violated, then the remaining zero system component is evenly distributed across all 3 branches.

Example:

The combination of p5590[3] = 0% and p5590[6] = 0% results in a voltage 0 in phase R. The phase voltage U_ST keeps its rated value, the sinusoidal curves of the two other differential voltages lie one above the other.

Description: Sets the signal source to activate asymmetrical phase voltages in the grid droop mode.

BI: p5591 = change, from a 0 signal to a 1 signal:

Activates asymmetry.

BI: p5591 = 0 signal:

Deactivates asymmetry.

Danger: By scaling the phase voltages (p5590), phase short-circuits as well as overcontrol of the phase voltages (with overvoltages and high harmonic components) can be realized. This means that special care must be taken when using this function.

The complete system with all of the connected components must be designed for the resulting current and voltage levels in order to rule out injury and material damage.

Notice: The function is activated with a 0/1 edge.

A fixed value saved in the ROM p5591 = 1 is therefore not sufficient to activate (for instance, after a POWER ON).

Note: The precondition to output asymmetrical voltages is that the grid droop control is activated (p5401 = 1 signal).

Duration and start of the asymmetry can be set with p5588 or p5589.

Caution: When changing the direction of rotation of the main machine using p1821, it must be checked as to whether the phase sequence of the exciter converter must also be changed.

Note: The amount of the value entered in the parameter is dynamically limited to the rated speed of the motor.

The value 0 is not permissible.

The sign of the hysteresis defines the rotating field of the stator current for the reverse field exciter depending on the mechanical direction of rotation.

The hysteresis is symmetrical around the value in parameter p6277.

The direction of rotation reversal using the sign of p6278 is not taken into account when calculating the slip.

Description: Sets the phase shift between the synchronizing voltage measured by the Voltage Sensing Module (VSM) and the actual drive converter input voltage.

Index:
[0] = Supply transformer
[1] = Island grid transformer

Warning: Switching-in with a significantly incorrectly parameterized offset angle (> 5 °) can cause a peak current intervention and / or triggering the crowbar thyristor.

Caution: If this parameter is changed in the "ready for operation" state and if a synchronizing voltage is already available at the VSM, under certain circumstances, a line supply fault can be signaled. When this occurs for the first time after changing the parameter, the fault can be ignored and acknowledged.

Note: This phase shift must be determined when commissioning the system.

Example:

If the converter input voltage (= secondary side voltage of the power transformer) lags the synchronizing voltage measured by the VSM by 30 °, then p6420 should be set to -30°.

Description: Sets the offset mode for voltage actual value sensing.

When the mode is enabled (p6903 = 0), for a pulse inhibit for stator and excitation and zero speed, the offset calibration is automatically started.

Offset calibration is inhibited when the mode is inhibited (p6903 = 1). The values last determined in p6870 and p6871 are saved. However, they can also be overwritten by a fixed value.

Value:
0: Offset calculation enabled
1: Offset calculation inhibited

Dependency: Refer to: p6870, p6871

Note: Offset mode can only be set for actual value sensing functions that are available in the hardware.

0	2000	[0] 1 [1] 1000 [2] 900 [3] 0 [4] 0

Description: Setting to parameterize the recorder.

The recorder supplies up to 64 internal variables (depending on the parameterization). The maximum recording time is 2000 ms. The variables are acquired in the current controller sampling time – and a pretrigger can be set. The values can then be acyclically written to the memory card.

The development and system test departments have the software necessary to decode the content.

Index:
[0] = Enable
[1] = Recording time
[2] = Pre-trigger time
[3] = Output message
[4] = Recording factor

Dependency: Refer to: A49998

Note: For index [0]:

Enables or disables the function.

p6999[0] = 0

Inhibits the function.

p6999[0] = 1

Enables the function.

For index [1]:

Sets the recording time, [ms].

A maximum of 8000 measuring points can be recorded across all drive objects. 1 measuring point is created in one current controller sampling time.

Example:

The "Recorder" function module is activated on 4 drive objects. The current controller sampling time (p0115[0]) is 250 µs.

--> every drive object can record a maximum of 8000/4 = 2000 measuring points.

--> the recording time that can be realized is 2000 * 0.250 ms = 500 ms.

Note:

- the recording time that can be realized is displayed in r6991[1].
- if the recording time is set too long, then it is automatically reduced to what can be realized.

For index [2]:

Sets the pretrigger time, [ms].

This time is included in the recording time and cannot be longer than the recording time p6999[1].

Note:

- when the recording time is automatically reduced, the pretrigger time is correspondingly reduced as well.
- the pretrigger time that can be realized is displayed in r6991[2].

For index [3]:

Enables or disables the output of message A49998 when the trigger event is triggered.

For index [4]:

p6999[4] = n, n = 0 ... 4

Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2] 2^n times, and reduces the number of signals 2^n times.

Example:

Number of drive objects = 1, p0115[0] = 250 µs, p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4

--> recording time: 2000 ms * 2^4 = 32 s, pre-trigger time:1000 ms * 2^4 = 16 s, number of signals 64/16 = 4.

When setting p6999[4] to 0, the results are as follows:

--> recording time: 2000 ms, pre-trigger time: 1000 ms, number of signals: 64

Dependency: Refer to: r7000

Caution: For a parallel connection, the following applies:

When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.

Note: For motors with separate winding systems (p7003 = 1) it is not possible to inhibit an individual power unit.

p7001 is automatically reset if a power unit is deactivated via p0125 or p0895.

Description: Specifies the motor winding system when power units are connected in parallel.

Value:
0: One-winding system
1: Several separate winding systems or motors
2: Two separate offset winding systems

Dependency: For p7003 = 2:

In order to permit separate, offset winding systems, wobbulation must first be deactivated (p1810.2 = 0). The magnitude and direction of the offset is parameterized in p6397.

When exiting commissioning, the circulating current control is automatically deactivated (p7035 = 0), and the compensation of the valve interlocking times is replaced by the appropriate stator resistance adaptation (p1780.7 = 1).

Refer to: p1802, p6397

Note: For p7003 = 0:

- the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352.
- the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1).
- individual Motor Modules can be activated and deactivated (p7001).

For p7003 = 1, 2:

- the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352).
- all Motor Modules are activated. It is not possible to deactivate a Motor Module.

Dependency: Refer to: p7761, p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

For bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

Description: OEM exception list (p7764[0...n] for setting parameters that should be excluded from know-how protection.

p7764[0...n], with n = p7763 - 1

Dependency: The number of indices depends on p7763.

Refer to: p7763

Note: KHP: Know-How Protection

Even if know-how protection is set, parameters in this list can be read and written to.

p7765 KHP configuration / KHP config

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410

P-Group: -	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
-	-	0000 bin

Description: Configuration settings for know-how protection.

For bit 00, 01:

When KHP is activated, this means that the OEM can define whether the parameters and DCC data encrypted on the memory card should be protected before using on other memory cards/Control Units.

For bit 02:

This means that the OEM can define whether it is possible or not to trace the drive data using the device trace function although KHP is activated.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Extended copy protection - linked to the memory card and CU	Yes	No	-
01	Basic copy protection - linked to the memory card	Yes	No	-
02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

Dependency: Refer to: p7766, p7767, p7768

Note: KHP: Know-How Protection

For copy protection, the serial numbers of the memory card and/or Control Unit are checked.

The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.

For bit 00, 01:

If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.

There is no copy protection if both bits are set to 0.

p7766[0...29] KHP password input / KHP passw input

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410

P-Group: -	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 0
Min	**Max**	**Factory setting**
-	-	-

Description: Sets the password for know-how protection.

Example of a password:

123aBc = 49 50 51 97 66 99 dec (ASCII characters)

[0] = character 1 (e.g. 49 dec)

[1] = character 2 (e.g. 50 dec)

...

[5] = character 6 (e.g. 99 dec)

[29] = 0 dec (completes the entry)

Dependency: Refer to: p7767, p7768

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

When using the STARTER commissioning tool, the password should be entered using the associated dialogs.

The following rules apply when entering the password:

- password entry must start with p7766[0].
- no gaps are permissible in the password.
- entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).

Note: KHP: Know-How Protection

When reading, p7766[0...29] = 42 dec (ASCII character = "*") is displayed.

Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection.

Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated.

A product-specific list of these parameters is also available in the corresponding List Manual.

-	-	-

Description: Sets the reference serial number for the memory card.

Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.

Dependency: Refer to: p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

- the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data".
- SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

p7770 NVRAM action / NVRAM action

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM31, TM41, TM17, TM15, TM15DI_DO, TM120, TM150, TB30, TM54F_MA, TM54F_SL, ENC, HUB

P-Group: -	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	3	0

Description: Sets the action to be executed for NVRAM data.

At the end of the action the value is automatically set to 0.

Value:
0: Inactive
1: Load NVRAM data to parameters
2: Load parameters to NVRAM
3: Reset

Notice: After action p7770 = 1 no more pulses may be enabled.

After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.

Note: If value = 1:

This action loads the NVRAM data to the parameters.

If value = 2:

This action loads the parameters to the NVRAM.

If value = 3:

This action sets parameters p7771 ... p7774 to the factory setting.

It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

p7775 NVRAM data backup/import/delete / NVRAM backup

CU_I, CU_NX_CX, CU_S_AC_DP, CU_S_AC_PN, CU_S120_PN, CU_S150_PN, CU_S120_DP, CU_S150_DP, CU_I_D410

Min	**Max**	**Factory setting**
0	17	0

Description: Setting to backup/import/delete NVRAM data.

NVRAM data are non-volatile data in the device (e.g. fault buffer).

For NVRAM data actions, the following data are excluded:

- crash diagnostics
- CU operating hours counter
- CU temperature
- safety logbook

Value:

0: Inactive
1: NVRAM data backup to memory card
2: Import NVRAM data from the memory card
3: Delete NVRAM data in the device
10: Error when clearing
11: Error when backing up, memory card not available
12: Error when backing up, insufficient memory space
13: Error when backing up
14: Error when importing, memory card not available
15: Error when importing, checksum error
16: Error when importing, no NVRAM data available
17: Error when importing

Notice: For value = 2, 3:

These actions are only possible when pulses are inhibited.

Note: After the action has been successfully completed, the parameter is automatically set to zero.

The actions importing and deleting NVRAM data immediately initiate a warm restart.

If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

p7786[0...n] Service report / Service report

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, B_INF

Can be changed: U, T	**Calculated:** -	**Access level:** 4
Data type: Unsigned16	**Dyn. index:** PDS, p0120	**Func. diagram:** -

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
-	-	0000 0000 0000 0000 bin

Description: Service parameter to internally document repairs.

After a component has been replaced, this must be confirmed using p7786[PDS].x = 0/1. The "Generate report" function is then automatically executed.

After the procedure has been completed, p7786[PDS] is automatically set = 0.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Control Interface Module (CIM) replaced	Yes	No	-
01	Valve 1 replaced	Yes	No	-
02	Valve 2 replaced	Yes	No	-
03	Valve 3 replaced	Yes	No	-
04	Valve 4 replaced	Yes	No	-
05	Valve 5 replaced	Yes	No	-
06	Valve 6 replaced	Yes	No	-
15	Generate report	Yes	No	-

Notice: The write process can take several minutes (p7786[PDS].x = 1). It is not permissible that the device is switched off during the procedure (only when p7786 = 0).

Note: The power unit involved can be assigned the correct P index using p0124 (power unit detection via LED).

p7788 Power unit sign-of-life monitoring tolerance window / PU SoL monit tol

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF

Can be changed: C2(2), U, T	**Calculated:** -	**Access level:** 4

Min	**Max**	**Factory setting**
1	1000	10

Description: Sets the tolerance window for the sign of life monitoring for communication to the power unit.

Dependency: Refer to: A30853

Note: An active window is generated by means of DRIVE-CLiQ telegrams.

If more than one sign-of-life error appears in the window, then A30853 is output.

The lower the value in p7788, the greater the monitoring tolerance.

p7789 Power unit sign-of-life monitoring fault threshold / PU SoL monit F_thr

SERVO, VECTOR, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF

Min	**Max**	**Factory setting**
0	1000	1

Description: Sets the number of consecutive sign-of-life errors that are tolerated for communication to the power unit.

Dependency: Refer to: F30008

Note: F30008 is output in the case of a fault.

The higher the value in the parameter, the higher the monitoring tolerance.

Description: Sets the individual signals for the component trace.

For p7790[0...15] = 0, the component trace is deactivated.

For index [0...7]:

The signals are set in p7790[0...7], whose characteristic is to be recorded over time.

If "No signal" is set for a trace channel, then the recording duration of the other time characteristics is increased.

For index [8...15]:

The signals are set in p7790[8...15], whose instantaneous value is to be recorded.

Value:
0: No signal
1: Pulse frequency
2: Phase current U
3: Phase current V
4: Phase current W
5: IGBT chip temperature
6: Heat sink temperature
7: DC link voltage
8: Modulat_depth
9: Angle

[11] = Trace channel 11
[12] = Trace channel 12
[13] = Trace channel 13
[14] = Trace channel 14
[15] = Trace channel 15

Dependency: Refer to: p7791, p7792

Refer to: A01302

Note: In the operation state, when a trigger event occurs, the trace data of the signals are saved in the component. The oldest trace data is overwritten after more than 5 trigger events.

The trigger event can be set in p7791.

By activating p7792, the trace data of the component is written to files on the non-volatile storage medium (memory card). Experts can then evaluate this data.

p7791 Component trace trigger / Comp trace trigger

SERVO, VECTOR, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF (Parallel), B_INF

Description: Sets the trigger event for the component trace.

Value:
0: Overcurrent, overvoltage, ground fault, Uce
1: Time-critical message
2: Uce

Dependency: Refer to: p7790, p7792

Note: F30001 is output if the power unit detects an overcurrent condition.

F30002 is output if the power unit detects an overvoltage condition in the DC link.

F30021 is output if the power unit detects a ground fault.

F30022 is output if the power unit detects an Uce fault.

p7792 Upload component trace data / Upload comp trace

SERVO, VECTOR, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF (Parallel), B_INF

Description: Setting to upload and save the trace data of the component trace.

Experts can then evaluate this data.

For p7792 = 1, the trace data of the component is written to files on the memory card in a non-volatile fashion.

The parameter is then automatically set to zero.

Value:
0: Inactive
1: Upload and save active

Dependency: Refer to: p7790, p7791

Notice: Trace files of this component already available on the non-volatile storage medium are overwritten after backup has been activated.

Description: Sets the behavior for the automatic firmware update of the DRIVE-CLiQ components.

Value:
0: Deactivated
1: Upgrade and downgrade
2: Upgrade

Notice: If this parameter is changed, it only becomes effective the next time that the drive system boots.

Note: The firmware is automatically updated when the system boots. The boot can take several minutes.

After the update has been completed, it is necessary to carry out a new POWER ON (switch-off/switch-on) for the components involved.

The firmware update procedure is displayed as follows:

Control Unit (LED RDY):

Flashes yellow with 0.5 Hz --> firmware is being updated.

Flashing yellow with 2 Hz --> POWER ON is required for the components involved.

Components involved:

Flashing red/green with 0.5 Hz --> firmware is being updated.

Flashing red/green with 2 Hz --> POWER ON of the components is required.

Only components from firmware version 2.5 support the red/green flashing at 2 Hz.

Description: Activating the firmware download for the DRIVE-CLiQ components specified in p7828.

1: Activate download.

-1: activate the download and carry out a reset.

0: Download successfully completed.

> 1: Fault code

011: DRIVE-CLiQ component has detected a checksum error.

015: The selected DRIVE-CLiQ components did not accept the contents of the firmware file.

018: Firmware version is too old and is not accepted by the component.

019: Firmware version is not suitable for the hardware release of the component.

101: After several communication attempts, no response from the DRIVE-CLiQ component.

140: Firmware file for the DRIVE-CLiQ component not available on the memory card/device memory.

143: Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.

144: When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card/device memory is defective.

145: Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.

156: Component with the specified component number is not available.

Additional values:

Only for internal Siemens troubleshooting.

Dependency: Refer to: p7828

Note: p7829 is automatically set to 0 after the firmware has been successfully downloaded.

The new firmware only becomes active at the next system run-up.

Description: Displays the version of the firmware stored on the memory medium of the drive device.

Depending on the drive device being used, the memory medium is a memory card, or an internal non-volatile device memory.

Index:
[0] = Internal
[1] = External
[2] = Parameter backup

Note: For index [0]:

Displays the internal firmware version (e.g. 04402315).

This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions.

For index [1]:

Displays the external firmware version (e.g. 04040000 -> 4.4).

For automation systems with SINAMICS Integrated this is the runtime version of the automation system.

For index [2]:

Displays the internal firmware version of the parameter backup.

With this CU firmware version, the parameter backup was saved, which was used when powering up.

-32786	32767	0

Description: Sets the global and unique component number in a drive system with several Control Units.

Each index of the parameter corresponds to a possible local component number on the corresponding Control Unit.

The indices are allocated to the global component numbers as follows:

p7859[0]: Not used

p7859[1]: Sets the global component number for the local component number 1

p7859[2]: Sets the global component number for the local component number 2

...

p7859[199]: Sets the global component number for the local component number 199

Notice: This parameter is preferably set via suitable commissioning tool (e.g. UpdateAgent, STARTER, SCOUT).

Changing the parameter via the AOP (Advanced Operator Panel) or BOP (Basic Operator Panel) can destroy a valid unique setting.

Note: The parameter is not influenced by setting the factory setting.

Description: Sets the priority for processing the existing drive objects in the system.

The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check.

With the factory setting the following priorities regarding processing are applicable:

- the drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK

- if they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.

Description: Displays the sampling times currently present on the drive unit.

r7901[0...63]: sampling times of hardware time slices.

r7901[64...82]: sampling times of software time slices.

r7901[x] = 0, means the following:

No methods have been registered in the time slice involved.

Note: The basis for the software time slices is T_NRK = p7901[15].

Min	**Max**	**Factory setting**
0000 hex	FFFF FFFF hex	0000 hex

Description: Sets the COB-ID for the emergency message (error telegram).
It corresponds to the CANopen objects:
- 1014 hex: COB-ID

Note: If, when downloading, the pre-set value 0 is downloaded, then the CANopen pre-set value 80 hex + Node-ID is automatically set.
Online, the value 0 is rejected as, according to the CANopen Standard, COB-ID 0 is not permitted here.
The changeover of the node ID using the hardware switch at the Control Unit or per software has no effect on the COB-ID EMCY. The saved value remains effective.

p8604[0...1] CAN life guarding / Life guarding

P-Group: -	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	65535	0

Description: Sets the life guarding parameter for the following CANopen objects:

- 100C hex: Guard Time

- 100D hex: Life Time Factor

The life time is derived by multiplying guard time by the life time factor.

Index: [0] = Time interval [ms] for the life time
[1] = Factor for the lifetime

Dependency: Refer to: p8606

Refer to: F08700

Note: For p8604[0] = 0 and/or p8604[1] = 0, the life guarding event service (monitoring the node guarding, fault F08700 with fault value = 2) is deactivated.

The node guarding protocol is active without the life guarding event service, if the heartbeat protocol is deactivated (p8606 = 0).

p8606 CAN Producer Heartbeat Time / Prod Heartb Time

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0 [ms]	65535 [ms]	0 [ms]

Description: Sets the time [ms] to cyclically send heartbeat telegrams.

The smallest cycle is 100 ms.

For p8606 = 0, heartbeat telegrams are not sent.

Dependency: Refer to: p8604

Note: Corresponds to the CANopen object 1017 hex.

Activating the heartbeat protocol automatically deactivates the node guarding.

r8607[0...3] CAN Identity Object / Identity object

Description: General device information display.

Index: [0] = Vendor ID
[1] = Product code
[2] = Revision number
[3] = Serial number

Note: Corresponds to the CANopen object 1018 hex.

For index [3]:

The SINAMICS serial number comprises 60 bits.

Of these bits, the following are displayed in this index:

Bits 0 ... 19: Consecutive number

Bits 20 ... 23: Production ID

- 0 hex: Development
- 1 hex: P1 unique number
- 2 hex: P2 unique number
- 3 hex: WA unique number
- 9 hex: Pattern
- F hex: All others

Bits 24 ... 27: Month of manufacture (0 means January, B means December)

Bits 28 ... 31: Year of manufacture (0 means 2002)

Description: As a result of a Bus Off error, the CAN controller is set into the initialization state.

For index [0]:

The CAN controller is manually started after resolving the cause of the error with p8608[0] = 1

For index [1]:

The automatic CAN bus start function is activated using p8608[1] = 1.

At 2 second intervals, the CAN controller is automatically restarted until the cause of the error has been resolved and a CAN connection has been established.

Value:
0: Inactive
1: Start CAN controller

Index:
[0] = Manual controller start function
[1] = Activating the automatic controller start function

Note: For index [0]:

This parameter is automatically reset to 0 after start.

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0000 hex	FFFF 1000 hex	0000 hex

Description: Displays the Pre-defined Error Field of the CAN node.

It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history.

The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code.

Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code.

CANopen error code:

0000 hex: No error present.

8110 hex: Alarm A08751 present.

8120 hex: Alarm A08752 present.

8130 hex: Alarm A08700(F) with alarm value = 2 present.

1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799)

1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700)

All drive objects are acknowledged by writing the value 0 to index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

Index:
[0] = Number of all faults in the drive unit
[1] = Actual drive number/fault number

Description: Sets the identifier (client/server and server/client) of the additional SDO server.

Using these SDO servers, it is possible to access manufacturer-specific CANopen objects of the supported drive objects.

Index: [0] = COB-ID drive object from the client to the server

1	127	126

Description: Display or setting of the CANopen Node ID.

The Node ID can be set as follows:

1) Using the address switch on the Control Unit.

--> p8620 can then only be read and displays the selected Node ID.

--> A change only becomes effective after a POWER ON.

--> CANopen Node ID and PROFIBUS address are identical.

2) Using p8620

--> Only if address 0 is set using the address switch.

--> the Node ID is set as standard to 126.

--> A change only becomes effective after save and POWER ON.

Dependency: Refer to: r8621

Note: Every node ID change only becomes effective after a POWER ON.

The active node ID is displayed in r8621.

The parameter is not influenced by setting the factory setting.

It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

Description: Setting the bit rate for the CAN bus.

The appropriate bit timings are selected that are defined in p8623 in the associated sub-index.

Example:

Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6].

Value:
0: 1 Mbit/s
1: 800 kbit/s
2: 500 kbit/s
3: 250 kbit/s
4: 125 kbit/s
5: 50 kbit/s
6: 20 kbit/s
7: 10 kbit/s

Dependency: Refer to: p8623

Description: Sets the bit timing for the C_CAN controller to the associated and selected bit rate (p8622).

Bits are distributed to the following parameters of the C_CAN controller in p8623[0...7]:

Bit 0 ... 5: BRP (Baud Rate Prescaler)

Bit 6 ... 7: SJW (Synchronization Jump Width)

Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point)

Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point)

Bit 15: Reserved

Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension)

Bit 20 ... 31: Reserved

Example:

Bit rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6

Recommendation: Use the factory setting when setting the bit timing.

For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Description: Sets the automatic BICO interconnection of the CANopen control word.

Value:
0: No interconnection
1: Interconnection

Dependency: Refer to: r2050, r2090, r2091, r2092, r2093, r8750, r8795, r8850, r8890, r8891, r8892, r8893

Note: The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer.

For SINAMICS S120 with CBC10, the PZD interface IF2 is used:

BI: p0840.0 = r889x.0

BI: p0844.0 = r889x.1

BI: p0848.0 = r889x.2

BI: p0852.0 = r889x.3

BI: p2103.0 = r889x.7

For SINAMICS S110, the PZD interface IF1 is used:

BI: p0840.0 = r209x.0

BI: p0844.0 = r209x.1

BI: p0848.0 = r209x.2

BI: p0852.0 = r209x.3

BI: p2103.0 = r209x.7

The write access is rejected if a CANopen control word is not mapped at one of these locations.

This causes the commissioning tool to interrupt the project download.

Description: Display and connector output to interconnect standardized I16 setpoint CANopen objects of the profile torque mode for SDO transfer.
An index can only be used, if the corresponding object has not been mapped in a PDO.

Index: [0] = Target torque

Note: For index [0]:
Corresponds to the CANopen object 6071 hex + 800 hex * x (x: Drive number 0 ... 7).
The displayed parameter value is scaled via the reference torque p2003:
4000 hex corresponds to p2003

Description: The factor converts the required velocity units into the internal velocity units (U/s).
With the factory setting, for CANopen, the velocity units are increments/second.
The parameter corresponds to the CANopen object 6094 hex.
The internal velocity is calculated as follows:
n_set_internal = object 6094.1 / object 6094.2 * 1/(p0408 * 2^p0418) * n_set_bus

Description: Project selection for SINAMICS Link.

Value:
8: Project 8 participants, 32 words
12: Project 12 participants, 24 words
16: Project 16 participants, 16 words
64: Project 64 participants, 16 words

Note: SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).

The parameter must be set the same for all participants.

A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

p8812[0...1] SINAMICS Link clock cycle settings / Clock cyc set

Min	**Max**	**Factory setting**
0	2000	[0] 1 [1] 2000

Description: Sets the clock cycle for SINAMICS Link.

For index [0]:

0 = clock synchronous mode not activated, 1 = clock synchronous mode activated

For index [1]:

Possible values: 500, 1000, 2000 µs

Index:
[0] = Activate isochronous mode
[1] = Bus CC [µs]

Dependency: Refer to: p8811

Note: SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).

A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

For index [0]:

Is applicable for the synchronization of the application. The SINAMICS Link itself is always synchronous.

For index [1]:

The value must be set the same for all participants.

When newly selecting the project p8811, p8812[1] is set to the factory setting.

For p8811 = 8, 12, 16 the following applies:

Min/max/factory setting: 500/500/500 µs

For p8811 = 64, the following applies:

Min/max/factory setting: 1000/2000/2000 µs

Description: Selects the PZD interface for the clock cycle synchronization functionality and PROFIsafe.

Value:
1: Interface 1 (IF1)
2: Interface 2 (IF2)

Index:
[0] = Isochronous mode
[1] = PROFIsafe

Dependency: Refer to: p8839

Note: A change only becomes effective after POWER ON, reset or project download.

Example:

p8815[0] = 1: IF1 supports the isochronous mode.

p8815[1] = 2: IF2 supports PROFIsafe.

p8835 CBE20 firmware selection / CBE20 FW sel

Description: Selects the firmware version for the CBE20.

Value:
1: PROFINET Device
2: PROFINET gate
3: SINAMICS Link
4: EtherNet/IP
5: Modbus TCP
99: Customer-specific from the OEM directory

Note: A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

P-Group: Communications	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	64	0

Description: Selects the node address for the SINAMICS Link on the Communication Board Ethernet 20 (CBE20).

p8836 = 0: SINAMICS Link deactivated

p8836 = 1 ... 64: SINAMICS Link node address

Dependency: Refer to: p8811, p8835

Note: The maximum number of permitted participant addresses is limited by the project selection p8811.

SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3).

A change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

p8837 IF2 STW1.10 = 0 mode / IF2 STW1.10=0

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41, ENC

Data type: Integer16	**Dyn. index:** -	**Func. diagram:** -
P-Group: Communications	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	2	2

Description: Sets the processing mode for PROFIdrive STW1.10 "master control by PLC".

Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.

Value:
0: Freeze setpoints and continue to process sign-of-life
1: Freeze setpoints and sign-of-life
2: Do not freeze setpoints

Recommendation: Do not change the setting p2037 = 0.

Note: If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

P-Group: Communications	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	99	99

Description: Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).

Value:
0: Inactive
1: Control Unit onboard
2: COMM BOARD
99: Automatic

Index:
[0] = Interface 1
[1] = Interface 2

Dependency: Refer to: p2030, p8815

Note: For value = 99 (automatic) the following applies:

- if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1.

- if a CBE20 is inserted, then the following applies:

-- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2.

-- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2.

- CAN CBC10 always communicates via IF2.

For a value not equal to 99 (automatic) the following applies:

- both indices must be set to a number not equal to 99 (automatic).

A change only becomes effective after POWER ON, reset or download.

p8840 COMM BOARD monitoring time / CB t_monit

CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)

Data type: FloatingPoint32	**Dyn. index:** -	**Func. diagram:** -
P-Group: Communications	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0 [ms]	65535000 [ms]	20 [ms]

Description: Sets the monitoring time to monitor the process data received via COMM BOARD.

If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.

Dependency: Refer to: p8835

Note: This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus.

For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4, 5).

For CBE20 firmware version Modbus TCP (p8835 =5) then the fieldbus data traffic is also monitored.

Value = 0: Monitoring is deactivated.

p8841[0...239] COMM BOARD send configuration data / CB s config_dat

CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)

Min	**Max**	**Factory setting**
0	65535	0

Description: Sets the send configuration data for the COMM BOARD.

The setting is activated with p8842.

Dependency: Refer to: p8842

Note: The configuration data are specific to the inserted COMM BOARD.

For CBE20, the configuration data are not relevant.

p8842 Activate COMM BOARD send configuration / CB s config act

CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)

P-Group: Communications	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	1	0

Description: Activate a modified send configuration for COMM BOARD.

With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.

Dependency: Refer to: p8841

Note: For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted.

For CBE20, the parameter is only active for firmware selection "SINAMICS Link" (p8835 = 3).

r8843.0...2 BO: IF2 PZD state / IF2 PZD state

Bit	Signal name	1 signal	0 signal	FP
00	Setpoint failure	Yes	No	-
01	Clock cycle synchronous operation active	Yes	No	-
02	Fieldbus operation	Yes	No	-

Dependency: Refer to: p2044

Note: When using the "setpoint failure" signal, the bus can be monitored and an application-specific response triggered when the setpoint fails.

p8844 IF2 fault delay / IF2 F delay

SERVO, VECTOR, HLA, SERVO_AC, VECTOR_AC, SERVO_I_AC, VECTOR_I_AC, A_INF, S_INF, R_INF, B_INF, TM41, ENC

Min	**Max**	**Factory setting**
0 [s]	100 [s]	0 [s]

Description: Sets the delay time to initiate fault F01910 after a setpoint failure.

The time until the fault is initiated can be used by the application. This means that is is possible to respond to the failure while the drive is still operational (e.g. emergency retraction).

Dependency: Refer to: r2043

Min	**Max**	**Factory setting**
1.00 [ms]	16.00 [ms]	4.00 [ms]

Description: Sets the sampling time for the cyclic interface 2 (IF2).

Note: The system only permits certain sampling times and after writing to this parameter, displays the value that has actually been set.

For clock cycle synchronous operation, the specified bus cycle time applies (Tdp).

r8849[0...139] COMM BOARD receive configuration data / CB r config_dat

Dependency: Refer to: r8860, r8890, r8891, r8892, r8893

Notice: Where there is a multiple interconnection of a connector output, all the connector inputs must either have Integer or FloatingPoint data types.

A BICO interconnection for a single PZD can only take place either on r8850 or r8860.

Note: IF2: Interface 2

PZD1 to PZD4 are displayed bit-serially in r8890 to r8893.

Description: Displays the COMM BOARD diagnostics data.

Note: The display depends on the COMM BOARD being used.

For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4).

Example for CBE20:

r8858[0] = 4201 --> Siemens CBE20

r8858[1] = 3 --> firmware version = SINAMICS Link (see p8835)

r8858[2 ... 39] --> only for internal Siemens diagnostics.

r8859[0...7] COMM BOARD identification data / CB ident_data

CU_S120_PN (COMM BOARD, PN CBE20), CU_S150_PN (COMM BOARD, PN CBE20), CU_S120_DP (COMM BOARD, PN CBE20), CU_S150_DP (COMM BOARD, PN CBE20)

Description: Sets the DHCP mode for the Industrial Ethernet interface (X127) on the Control Unit.

The actual DHCP mode is displayed in parameter r8914.

Value:
0: DHCP off
2: DHCP on, identification using MAC address
3: DHCP on, identification via name of station

Dependency: Refer to: p8905, r8914

Note: The interface configuration (p8900 and following) is activated with p8905.

The parameter is not influenced by setting the factory setting.

Description: Setting to activate the interface configuration for the Industrial Ethernet interface (X127) on the Control Unit.

p8905 is automatically set to 0 at the end of an operation.

Value:
0: No function
1: Activate configuration
2: Activate and save configuration
3: Delete configuration

Dependency: Refer to: p8900, p8901, p8902, p8903, p8904

Refer to: A08561

Note: When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8905 is set = 1 or 2.

For p8905 = 1:

The interface configuration (p8900 and following) is activated.

For p8905 = 2:

The interface configuration (p8900 and following) is activated and saved to non-volatile memory.

For p8905 = 3:

The interface configuration is reset to the factory setting at all points.

The factory settings for the interface configuration are loaded on activation (p8905 = 1) or at the next POWER ON.

Description: Activation of the FTP server.

Permits the FTP access to the /INSTALL/SINAMICS directory of the memory card.

Value:
0: No
1: Yes

Note: Activation of the FTP server becomes effective immediately.

Deactivation only becomes effective after a POWER ON of the Control Unit.

Before the first commissioning, the FTP server is activated irrespective of the parameter setting.

Description: Sets the DHCP mode for the onboard PROFINET interface on the Control Unit.

The actual DHCP mode is displayed in r8934.

Value:
0: DHCP off
2: DHCP on, identification using MAC address
3: DHCP on, identification via name of station

Dependency: Refer to: p8925, r8934

Notice: When the DHCP mode is active (p8924 not equal to 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.

Note: The interface configuration (p8920 and following) is activated with p8925.

The active DHCP mode is displayed in parameter r8934.

The parameter is not influenced by setting the factory setting.

Description: Setting to activate the interface configuration for the onboard PROFINET interface on the Control Unit.

p8925 is automatically set to 0 at the end of the operation.

Value:
0: No function
1: Activate configuration
2: Activate and save configuration
3: Delete configuration

Dependency: Refer to: p8920, p8921, p8922, p8923, p8924

Refer to: A08563

Notice: When the DHCP mode is active (p8924 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.

Note: When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8925 is set = 1 or 2.

For p8925 = 1:

The interface configuration (p8920 and following) is activated.

For p8925 = 2:

The interface configuration (p8920 and following) is activated and saved to non-volatile memory.

For p8925 = 3:

Restores all memory locations for the interface configuration to the factory settings.

The factory settings for the interface configuration are loaded on activation (p8925 = 1) or at the next POWER ON.

Dependency: Refer to: r8961, r8962

Note: The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10).

For PROFINET, the following applies:

For two connections (Shared Device or system redundancy) the display in the index depends on the sequence in which the connections are established.

The IP addresses of controllers 1 and 2 are displayed in r8961 and r8962.

The following states are displayed for system redundancy:

Primary controller: r8936[x] = 13

Backup controller: r8936[x] = 11

If value = 10:

If the connection remains in this state, then when using PROFINET IRT the following can apply:

- topology error (incorrect port assignment).
- synchronization missing.

For EtherNet/IP, the following applies:

Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

1: Activate configuration
2: Activate and save configuration
3: Delete configuration

Dependency: Refer to: p8940, p8941, p8942, p8943, p8944

Refer to: A08565

Notice: When the DHCP mode is active (p8944 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.

Note: For CBE20, the parameter is only valid for firmware version "PROFINET Device" (p8835 = 1), "EtherNet/IP" (p8835 = 4) or "MODBUS TCP (p8835 = 5). Otherwise, it is locked.

This restriction is not applicable for the CBE25.

When a project is downloaded, the interface configuration is only activated if parameter p8945 is set = 1 or 2 in the offline project.

For p8945 = 1:

The interface configuration (p8940 and following) is activated.

For p8945 = 2:

The interface configuration (p8940 and following) is activated - and is saved in a non-volatile fashion (retentively).

For p8945 = 3:

All storage locations for the interface configuration are restored to the factory setting.

The factory setting of the interface configuration is loaded when activated (p8945 = 1) or with the next POWER ON.

Description: Setting for the behavior of a PROFIsafe communication connection depending on another isochronous communication connection.

Value:
0: No
1: Yes

Recommendation: A value of 1 is recommended, if problems are encountered with the PROFIsafe connection when synchronizing.

Note: If value = 1:

A PROFIsafe connection is only accepted if an isochronous connection exists.

Relevant, if PROFIsafe and isochronous operation are configured via various communication connections (e.g. PROFINET Shared Device).

Description: Displays the statistics for the acyclic DRIVE-CLiQ communication of a component.

The component is preset in p9221.

The entry comprises the following elements:

Index 0: Parameter Id.

Index 1: Number of messages sent.

Index 2: Minimum time of all acyclic tasks referred to parameter Id (index 0).

Index 3: Maximum time of all acyclic requests referred to the parameter Id (index 0).

Index 4: Average of all acyclic requests referred to the parameter Id (index 0).

The time unit is 10 µs.

Dependency: The number of statistic entries is displayed in p9220.

In p9221, the component Id can be set whose statistic is to be displayed.

Refer to: r9220, p9221

Note: As a statistic entry comprises 5 data, when calling the entries via the terminal, a size that represents a multiple of 5 must be specified.

Example:

The 2nd entry should be called:

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.

This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.

The value should be set, so that it is precisely at 2^n revolutions, so that when the range that can be represented (+/-2048) overflows, this does not cause the position actual value to jump.

The modulo function is deactivated for a value = 0.

Dependency: Refer to: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-

Dependency: Refer to: C01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.

Setting criteria if the motion monitoring functions are executed with an encoder.

- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.

- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.

- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: Refer to: p0115, p9300, p9511

Refer to: F01652

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1).

The monitoring clock cycle from p9300 must be an integer multiple of this parameter.

In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.

The clock cycle time of the actual value sensing should not be set to more than 8 ms.

A change only becomes effective after a POWER ON.

Description: Sets the velocity limit for the "SAM" and "SBR" functions.

If the drive is being ramped down, but accelerates by the tolerance in p9548/p9348, then the SAM function identifies this and a STOP A is initiated.

The monitoring operates as follows:

- monitoring by SAM is activated for SS1 (or STOP B) and SS2 (or STOP C).
- the SAM limit value is frozen after the velocity limit in p9568/p9368 is undershot.
- SAM monitoring is still executed until the transition time to SOS/STO has expired.

Dependency: Refer to: r9713

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The parameter is only effective when PROFIsafe telegram 901 is selected.

By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.

If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C30711 with value 7001 is output and safety stop response STOP F.

Description: Sets the delay time, after which the stop response parameterized in p9612 for bus failure is executed.

Dependency: Refer to: p9363

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F).

The main use of the wait time is the function "Extended stopping and retraction" (ESR).

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

P-Group: Safety Integrated	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
-1	4	-1

Description: Sets the tolerance of the plausibility monitoring of the current and voltage angle.

A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.

An increase is advantageous, if the current or voltage at the motor become small.

Dependency: Refer to: p9507

Refer to: F30681, C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Reducing this value can have a negative impact on the actual value sensing and the plausibility check.

When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For synchronous motors, the value 4 must be set.

If value = -1:

- for synchronous motors, the calculation is automatically made with the value 4.
- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

5.00 [ms]	1000.00 [ms]	100.00 [ms]

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.

The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: Refer to: C30711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Min	**Max**	**Factory setting**
0.00 [µs]	100000.00 [µs]	25000.00 [µs]

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

A longer filter time results in a longer response time.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

The smoothing is realized with a 1st order lowpass filter

For p9387 = minimum value, the filter is deactivated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

0.00 [%]	1000.00 [%]	10.00 [%]

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).

- the value must be increased if C30711 has occurred with message value 1042.
- the value must be decreased if C30711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:

|p0305 x p9783| >= p9388 x 1.2

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: Refer to: r9785

Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

p9389 SI Motion actual value sensing sensorless accel. limit (MM) / ActVal sl a_lim MM

P-Group: Safety Integrated	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
10.00 [%]	3300.00 [%]	100.00 [%]

Description: Sets the acceleration limit to filter velocity fluctuations.

If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.

If this value is decreased, and this dampens the velocity peaks when accelerating.

- the value must be increased if C30711 with message value 1043 has occurred.
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784

Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9389 = maximum value, the filter is deactivated.

Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Sets the signal source (BO/CO parameter, BICO coded) to search in the signal sinks.

The question is answered:

How often is a connection made to a signal source in the drive object and from which index are these interconnections saved (r9482 and r9483)?

Dependency: Refer to: r9481, r9482, r9483, r9485, r9486

Description: Displays the number of BICO interconnections to the signal sink being searched for.

Dependency: Refer to: r9481, r9482, r9483, p9484, r9486

Note: The signal source to be searched is set in p9484 (BICO-coded).

The search result is contained in r9482 and r9483 and is specified by the count (r9485) and the first index (r9486).

Description: Displays the signal receiver list (Binector Input/Connector Input, BI/CI) for the first interconnections between this drive and other drives/drive objects.

Dependency: Refer to: r9490, r9492, p9493

Notice: A drive cannot be deleted if this list is not empty!

Otherwise, another drive would continue to attempt to read a signal from a drive that no longer existed.

Note: All indices of r9491 to p9493 designate the same interconnection.

r9491[x] contains the signal receiver and r9492[x] the matching signal source; p9493[x] can be set to modify the interconnection.

Min	**Max**	**Factory setting**
0 [°]	737280 [°]	0 [°]

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.

This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.

The value should be set, so that it is precisely at 2^n revolutions, so that when the range that can be represented (+/-2048) overflows, this does not cause the position actual value to jump.

The modulo function is deactivated for a value = 0.

Dependency: Refer to: p9501

Refer to: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

Note: SLP: Safely-Limited Position

SP: Safe Position

Description: Sets the function configuration for the safe motion monitoring functions.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Extended message acknowledgment	Yes	No	-
01	Setpoint velocity limit for STOP F	No	Yes	-
03	SS1 with OFF3 (brake response)	SS1E external stop	SS1 with OFF3	-
06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-

Dependency: Refer to: C01711

Note: For bit 00:

When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 06:

For the automatic test stop, the test stop can still be initiated via binector input p9705.

The automatic test stop is executed after power up, partial power up or a warm restart.

05	Actual value sensing sensorless edge modulation	Yes	No	-
06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-

Dependency: Refer to: C01711

Note: For bit 00:

When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:

When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 02:

This bit defines the type of motor, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for an induction motor.

For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300.

Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:

When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 05:

This bit defines the type of modulation, which the sensorless actual value sensing evaluates.

For bit = 0, the actual velocity is calculated for space vector modulation.

For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

For bit 06:

When the bit is active, the test stop of the Extended Functions and the test stop of the onboard F-DO is carried out. The onboard F-DO can be deactivated via p10046.

Also for the automatic test stop, the test stop of the F-DO can be started using binector input p10007. The test stop for Extended Functions can still be started via p9705.

The automatic test stop is executed after power up, partial power up or a warm restart.

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-

Dependency: Refer to: C01711

Notice: For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

0	1	0

Description: Setting for isochronous communication between PROFIdrive controller and Control Unit.

The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1).

If a PROFIdrive controller exchanges process data isochronously with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data isochronously.

Examples for isochronous communication:

- isochronous control for the motion control (e.g. SIMOTION).

- isochronous PROFIsafe master (e.g. SIMATIC S7-400F).

Value:
0: Communication not isochronous
1: Communication isochronous

Dependency: Refer to: C01711, A01796

Notice: As of firmware version 2.6, the parameter has no effect.

0.00000 [ms]	25.00000 [ms]	0.00000 [ms]

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.

Setting criteria if the motion monitoring functions are executed with an encoder.

- a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.

- the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.

- the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.

Dependency: Refer to: p0115

Refer to: F01652

Note: The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1).

The monitoring clock cycle from p9500 must be an integer multiple of this parameter.

In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.

The clock cycle time of the actual value sensing should not be set to more than 8 ms.

A change only becomes effective after a POWER ON.

Description: Sets the bit number for the safe most significant bit (MSB) of the Gx_XIST1 coarse position.

The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.

Dependency: Refer to: p0415, r0475, p9329

Note: For safety functions that are not enabled (p9501 = 0), the following applies:

- p9529 is automatically set the same as r0475 when the system boots.

For safety functions that are enabled (p9501 > 0), the following applies:

Description: Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

Min	**Max**	**Factory setting**
0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]

Description: Sets the switchover velocity to SOS/SLS level.

Below this velocity limit, for a transition to SOS/SLS level, standstill (zero velocity) is assumed.

The transition times from STOP C, D, E and the delay time when selecting SOS are canceled if this velocity threshold is fallen below. The wait time from p9569 is started, and after it has expired, SOS is active.

The transition time from a higher to a lower safety-limited velocity level is canceled when this velocity level is fallen below. The wait time from p9569 is started, and after it has expired, the new SLS level becomes active.

For a STOP C, this switchover velocity is the only criterion for prematurely activating an SOS. In the other cases mentioned here, it must first have been signaled that the axis had correctly braked.

Dependency: Refer to: p9501, p9551, p9552, p9553, p9554

Note: With p9567 = 0, reducing the wait time for the transition to SOS/SLS level is deactivated.

Description: Sets the velocity limit for the "SAM" and "SBR" functions.

If the drive is being ramped down, but accelerates by the tolerance in p9548/p9348, then the SAM function identifies this and a STOP A is initiated.

The monitoring operates as follows:

- monitoring by SAM is activated for SS1 (or STOP B) and SS2 (or STOP C).
- the SAM limit value is frozen after the velocity limit in p9568/p9368 is undershot.
- SAM monitoring is still executed until the transition time to SOS/STO has expired.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)

SBR: Safe Brake Ramp (safe brake ramp monitoring)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For p9568 = p9368 = 0, the following applies:

Description: Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.

Dependency: Refer to: r9713

Note: The parameter is only effective when PROFIsafe telegram 901 is selected.

By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.

If, during operation, a position actual value is determined, which cannot be scaled to the 16 bits, then message C0711 with value 7001 is output and safety stop response STOP F.

P-Group: Safety Integrated	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
-1	4	-1

Description: Sets the tolerance of the plausibility monitoring of the current and voltage angle.

A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps.

An increase is advantageous, if the current or voltage at the motor become small.

Dependency: Refer to: r9787

Refer to: F01681, C01711

Notice: Reducing this value can have a negative impact on the actual value sensing and the plausibility check.

When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For synchronous motors, the value 4 must be set.

If value = -1:

- for synchronous motors, the calculation is automatically made with the value 4.

- for induction motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).

Description: Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled.

The value must be greater than or equal to the motor magnetizing time (p0346).

Dependency: Refer to: C01711

Caution: The safety functionality is only completely guaranteed after this time has expired.

Notice: If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description: Sets the filter time for smoothing the actual value with sensorless actual value sensing.

Notice: A longer filter time results in a longer response time.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

The smoothing is realized with a 1st order lowpass filter

For p9587 = minimum value, the filter is deactivated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

0.00 [%]	1000.00 [%]	10.00 [%]

Description: Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA).

- the value must be increased if C01711 has occurred with message value 1042.
- the value must be decreased if C01711 has occurred with message value 1041.

For synchronous motors, the following condition must be fulfilled:

|p0305 x p9783| >= p9588 x 1.2

Recommendation: If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.

Dependency: Refer to: r9785

Refer to: C01711

Notice: If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
10.00 [%]	3300.00 [%]	100.00 [%]

Description: Sets the acceleration limit to filter velocity fluctuations.

If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur.

If this value is decreased, and this dampens the velocity peaks when accelerating.

- the value must be increased if C01711 with message value 1043 has occurred.
- the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.

To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784

Refer to: C01711

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9589 = maximum value, the filter is deactivated.

Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Sets the enable signal for the function "Safe Brake Control" (SBC) on the Control Unit.

Value:
0: Inhibit SBC
1: Enable SBC

Dependency: Refer to: p9802

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

Dependency: Refer to: p9812

Note: For the set stop response STOP B, in order that the OFF3 ramp is actually maintained, when just using Safety Basic Functions, the following must be carefully observed:

- the transition time STOP F to STOP A (p9658, p9858) must be set longer or equal to the SS1 delay time (p9652, p9852).

- if a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119).

0.00 [s]	300.00 [s]	0.00 [s]

Description: Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).

Recommendation: In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows:

Motor holding brake parameterized: delay time >= p1135 + p1228 + p1217

Motor holding brake not parameterized: delay time >= p1135 + p1228

Dependency: Refer to: p1135, p9852

Note: Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9612 = 1).

For a data cross-check between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

0	1	0

Description: Sets the drive-based braking response for the "Safe Stop 1" (SS1) function.

Value:
0: SS1 with OFF3
1: SS1E external stop

Note: SS1: Safe Stop 1 (Safe Stop 1, corresponds to Stop Category 1 acc. to EN60204)

SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

SS1E requires the externally initiated stop in order to be in conformance with stop Category 1.

With this parameter, a switchover is made from SS1 to SS1E, and the drive-based braking response of function SS1 (time controlled) of the Basic Functions is deactivated.

Description: Sets the transition period from STOP F to STOP A on the Control Unit.

Dependency: Refer to: r9795, p9858

Refer to: F01611

Note: For a data cross-check between p9658 and p9858, a difference of one Safety monitoring clock cycle is tolerated.

The set time is rounded internally to an integer multiple of the monitoring clock cycle.

If a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119). As a consequence, the drive can still be braked in a controlled fashion during this delay time.

STOP F: Defect in a monitoring channel (error in the data cross-check)

STOP A: STO as a result of a fault detected by Safety Integrated

Dependency: Refer to: r9713

Note: For index [0]:

The display of the load-side position actual value on the Control Unit is updated in the monitoring clock cycle.

For index [1]:

The display of the load-side position actual value on the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.

For index [2]:

The difference between the load-side position actual value on the Control Unit and load-side position actual value in the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.

For index [3]:

The maximum difference between the load-side position actual value on the Control Unit and the load-side position actual value on the second channel.

For index [4]:

Displays the load-side position actual value when enabling the function "Safe position via PROFIsafe".

The value is an average value from the values in index 0 and 1.

When the function is not enabled, the content corresponds to the value in index 0.

For index [5]:

The display of the maximum additional difference between the load-side position actual value on the Control Unit, and the load-side position actual value in the second channel, which can occur as a result of the actual value sensing delay in the EnDat 2.2 converter.

Input in p9542: p9708[3] + p9708[5], after performing the measurement for the mechanical tolerance by performing a test run, where, after completion, the maximum tolerance that has occurred is displayed in p9708[3].

Note: Regarding the units, this parameter should be interpreted as follows:

- linear axis: µm
- rotary axis: mdegrees

The value of this parameter is displayed in r9708 with units (mm or degrees).

The display is updated in the safety monitoring clock cycle.

For index [0]:

The display of the load-side position actual value on the Control Unit is updated in the monitoring clock cycle.

For index [1]:

The display of the load-side position actual value on the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.

For index [2]:

The difference between the load-side position actual value on the Control Unit and load-side position actual value in the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.

For index [3]:

The maximum difference between the load-side position actual value on the Control Unit and the load-side position actual value on the second channel.

For index [4]:

Displays the load-side position actual value when enabling the function "Safe position via PROFIsafe".

The value is an average value from the values in index 0 and 1.

For a 16-bit notation, the value is influenced using the scaling factor (p9574/p9374).

When the function is not enabled, the content corresponds to the value in index 0.

For index [5]:

The display of the maximum additional difference between the load-side position actual value on the Control Unit, and the load-side position actual value in the second channel, which can occur as a result of the actual value sensing delay in the EnDat 2.2 converter.

Input in p9542: r9713[3] + r9713[5], after performing the measurement for the mechanical tolerance by performing a test run, where, after completion, the maximum tolerance that has occurred is displayed in r9713[3].

Description: Displays the velocity resolution for safety-relevant motion monitoring functions.

For index [0]:

Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect.

For index [1]:

Displays the safe velocity accuracy based on the safe encoder accuracy

Index: [0] = Actual velocity resolution
[1] = Minimum velocity resolution

Note: For index [0]:

This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used.

Conversion of:

(internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle).

Example:

For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained.

For index [1]:

- for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only

Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary).

- for safety without encoder, index 1 is not relevant, and is always the value of zero.

Description: Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions.

Contrary to the parameterization of the SI limit values, this parameter specifies the actuator-side limit value and not the load-side limit value.

Recommendation: For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized.

- CI: p1051 = r9733[0]

The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722.

When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

r9733[0...2] CO: SI Motion setpoint speed limit effective / SI Mtn setp_lim

SERVO (Lin), SERVO_AC (Lin), SERVO_I_AC (Lin)

Can be changed: -	**Calculated:** -	**Access level:** 3
Data type: FloatingPoint32	**Dyn. index:** -	**Func. diagram:** 2820, 2824, 3630
P-Group: Safety Integrated	**Unit group:** 4_1	**Unit selection:** p0505
Not for motor type: -	**Scaling:** p2000	**Expert list:** 1
Min	**Max**	**Factory setting**
- [m/min]	- [m/min]	- [m/min]

Description: Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions.

Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value.

Recommendation: For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized.

- CI: p1051 = r9733[0]
- CI: p1052 = r9733[1]

Additional limiting can also be activated using connector input p1085 and p1088.

Index:
[0] = Setpoint limiting positive
[1] = Setpoint limiting negative
[2] = Setpoint limit absolute

Dependency: For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side)

For SDI negative: r9733[0] = 0

For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side)

For SDI positive: r9733[1] = 0

[x] = Selected SLS stage

Conversion factor from the motor side to the load side:

- motor type = rotary and axis type = linear: p9522 / (p9521 x p9520)
- otherwise: p9522 / p9521

Refer to: p9531, p9533

Notice: If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa.

If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.

Note: The unit changeover between linear and rotary axis is not implemented via the safety changeover (p9502) but by the linear motor changeover.

If the "SLS" or "SDI" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082.

The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722.

When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

-50.00 [%]	0.00 [%]	-20.00 [%]

Description: Sets the additional field-generating current for synchronous motors with sensorless actual value sensing.

The set value is referred to p0305.

This parameter ensures a "base load" for the motor.

The value must fulfill the following condition:

|p0305 x p9783| >= p9588 x 1.2

Dependency: Refer to: p9588

Refer to: C01711

Notice: Reducing this percentage value can adversely affect actual value sensing with synchronous motors.

If the value is increased, this results in an increased motor power loss.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).

For p9783 = maximum value, current injection is deactivated.

Current injection is not effective in the U/f control mode.

Note: This parameter does not provide any information about the actual accuracy of the acceleration sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used.

Conversion of:

(internal fixed value/ Tsi²) to m/s² (linear) or 1/s² (rotary) with Tsi = p9500 (SI motion monitoring clock cycle)

Example:

For Tsi = 12 ms, r9790 = 0.006944 m/s² (linear) or 0.019290 1/s² (rotary) is obtained.

Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle.

Result is 0.006944 m/s² (linear) or 0.019290 1/s² (rotary).

Description: Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module.

0: Inhibit SBC

1: Enable SBC

Dependency: Refer to: p9602

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

- the transition time STOP F to STOP A (p9658, p9858) must be set longer or equal to the SS1 delay time (p9652, p9852).
- if a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119).

Description: If, when comparing the actual topology and target topology, only error has occurred, that can be acknowledged, then using this parameter, a new comparison can be started - acknowledging the error in the target topology.

Differences that can be acknowledged:

- topology comparison, component shifted

- topology comparison, serial number of a component has been detected to be different (byte 3 = 1)

- topology comparison shows one component that is connected differently

The following parameter values are available:

p9904 = 1 --> the procedure is started.

p9904 = 0 after starting --> the procedure has been successfully completed.

p9904 = 1 after starting --> the procedure has not been successfully completed.

The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2.

Byte 2:

Number of structural differences.

Byte 3:

Number of differences that can be acknowledged (p9904).

Byte 4:

Number of differences. These differences can be resolved as follows:

- sets the topology comparison (p9906 or p9907/p9908).

- change over the actual topology.

The appropriate action should be selected corresponding to the message that is displayed/output.

Note: In order to permanently accept the acknowledgment of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).

Description: With p9905 = 1, the serial numbers and the hardware versions of all of the components are transferred from the actual topology into the target topology and a new comparison is started.

For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers.

With p9905 = 2, the serial numbers, the hardware versions and the article numbers of all of the components are transferred from the actual topology into the target topology and a new comparison is started.

For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers and article numbers.

Note: p9905 is automatically set to 0 at the end of the operation.

In order to permanently accept the data, it is necessary to save in a non-volatile fashion (p0977).

Description: Sets the type of comparison between the actual topology and target topology.

The comparison is started by setting the required value.

Value:
0: High: Compares the complete electronic rating plate
1: Medium: Compares the component type and the article number
2: Low: Compares the component type
3: Minimum: Compares the component class
99: Topology has different comparison stages

Note: The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9906 = 0: Component type, Article Number, Hardware version, Manufacturer, Serial No.

p9906 = 1: Component type, Article Number

p9906 = 2: Component type

P-Group: Topology	**Unit group:** -	**Unit selection:** -
Not for motor type: -	**Scaling:** -	**Expert list:** 1
Min	**Max**	**Factory setting**
0	99	0

Description: Sets the type of comparison of a component in the target topology with the actual topology.

The comparison is started by setting the required value.

Value:
0: High: Compares the complete electronic rating plate
1: Medium: Compares the component type and the article number
2: Low: Compares the component type
3: Minimum: Compares the component class
99: Topology has different comparison stages

Dependency: Refer to: p9907

Note: The electronic rating plate comprises the following data:
- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Article No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Article Number

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

0	1	1

Description: For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.

For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:
- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency: Refer to: p9904, p9905

Note: The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).

Special case for Control Unit and option slot modules:

When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Index 0 = license key character 1 (e.g. 69 dec)

Index 1 = license key character 2 (e.g. 65 dec)

...

Index 8 = license key character 9 (e.g. 65 dec)

Index 9 = license key character 10 (e.g. 0 dec)

...

Dependency: Refer to: r7843, p9921

Refer to: F13000, A13001, F13010

Notice: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

With the STARTER commissioning tool, the ASCII characters are not entered coded, i.e. the license key characters can be entered as printed in the Certificate of License. In this case, the commissioning tool codes the characters.

Note: For an invalid license key, all the indices have the value 0 dec.

Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-").

When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec.

After entering the license key, the license key must be activated (p9921).

The following fault and LED indicate that the licensing is not adequate:

- F13000 --> licensing not adequate
- LED READY --> flashes red at approximately 2 Hz

Description: Activates the entered license key.

The following is executed when activating the license key.

- the checksum of the entered license key is checked.
- the entered license key is saved in a non-volatile fashion on the memory card.
- re-enter the license key.

Value:
0: Inactive
1: Activate start license key

Dependency: Refer to: p9920

Refer to: F13000, A13001, F13010

Note: Before activation, the license key entered using parameter p9920 is checked. If this check identifies an error, activation is rejected. In this case, writing a 1 to p9921 is rejected.

When the license key has been activated, p9921 is automatically set to 0.

Description: Sets the configuration for the DRIVE-CLiQ diagnostics (error counter r9936).

Using this function, connections and cables of DRIVE-CLiQ connections can be checked for transfer errors. The error counter is evaluated in the PHY blocks involved.

Bit field:

Bit	Signal name	1 signal	0 signal	FP
00	Alarm for connection error	Yes	No	-

Dependency: Refer to: r9936, p9938

Refer to: A01839

Note: For bit 00:

To activate this function, p9938 must be set to 0 (inactive).

After changing the error counter (r9936), an appropriate alarm is output.

The alarm automatically disappears after 5 seconds.

For bit 08:

With p9937.8 = 1, the error counters are reset (r9936[0...199]).

After the reset, p9937.8 is automatically set to 0.

Description: For p9941 =1, the serial numbers of all components in the target topology are deleted (zero is written).

Through activation and deactivation this enables the actual topology components to be newly assigned to the target topology components.

Note: p9941 is automatically set to 0 at the end of the operation.

A warm restart is triggered automatically after p0009 = 0.

Description: Displays the active sampling time of the TM54F.

In this clock cycle, the debounced F-DIs (p10017) are evaluated, and converted over to SGEs.

In this clock cycle, also the F-DOs are controlled corresponding to the presently available SGAs.

This clock cycle corresponds to the smallest communication clock cycle that was entered in p10000[].

SGEs are transferred to the drives, and the SGAs received from the drives are transferred with the specific communication clock cycle of each drive in p10000[].

The value of a specific index of p10000[] represents the communication clock cycle of the drive, which is entered in the same index of p10010[].

0.00 [ms]	100.00 [ms]	1.00 [ms]

Description: Sets the debounce time for digital inputs.

The debounce time is accepted rounded off to whole milliseconds.

The debounce time acts on the following digital inputs:

- Failsafe digital inputs (F-DI).
- Single-channel digital inputs (DI).
- Single-channel digital input 22 (DI 22, read back input for the forced checking procedure).

Dependency: Refer to: p10117

Notice: To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]:

- if p0799[0] is less than 1 ms, then p10017 = 1 ms or a multiple integer of 1 ms.
- if p0799[0] is greater or equal to 1 ms, then p10017 must = p0799[0] - or must be a multiple integer of p0799[0].

Note: Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

The debounce result can be read in r10051.

The set debounce time impacts the response time of the safety function.

Dependency: Refer to: p9501, p9601, p10017, p10040, p10050, r10151

Note: If a safety function is assigned to an input (e.g. via p10022), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10040) of the input as NC contact or NO contact, and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

F-DI: Failsafe Digital Input

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

Description: Displays the events that lead to the transfer of failsafe signals to all drives assigned to the TM54F.

If the second channel of the TM54F transmits failsafe signals, then these are synchronized to the other channel. In this particular case, p10054 of the other TM54F channel should be evaluated.

Possibilities of resolving the situation:

- error during test stop: correctly perform the test stop.
- internal software error: no possibility of resolving this problem, POWER ON.
- internal synchronization problem: no possibility of resolving this problem, POWER ON.
- internal status error: no possibility of resolving this problem, POWER ON.
- parameterizing error: evaluate fault F35004 or F35006. Resolve parameterizing error. POWER ON. After the TM54F firmware has been updated, a POWER ON may be required.
- all other causes: remove the cause of the error and carry out a safe acknowledgment (p10006).

Dependency: Refer to: p10003, p10007, p10041, p10046

Note: The delay time must be set to a value greater than the debounce time (p10017).

Regardless of p10001, the forced checking procedure will pause for at least two safety monitoring clock cycles between each stage of the test.

The test stop is only performed if the safety output is being used (p10142).

Description: Selects a failsafe digital input (F-DI) for the "SLP retract" function.

A rising edge at this F-DI makes it possible to retract the axis, if at this instant in time indicates a violation of the SLP limit.

After safe acknowledgment of the active safety faults, the drive can be traversed in the direction of the permitted position range.

In the retract mode, SLP becomes inactive, and SDI, if enabled, is selected in the direction of the permitted position range.

A 0 signal at the F-DI for retraction, deactivates the active retraction mode (SLP becomes active again, and SDI selected corresponding to the actual F-DIs).

Value:
0: Function inactive
1: F-DI 0
2: F-DI 1
3: F-DI 2

Note: - retraction is only possible if SDI is not already selected in the opposite direction of the permitted position range.

- a discrepancy at this F-DI must be acknowledged using a safe acknowledgment.

The debounce time acts on the following digital inputs:

- Failsafe digital inputs (F-DI).
- Single-channel digital input 22 (DI 22, read back input for the forced checking procedure).

The debounce time is accepted rounded off to whole milliseconds.

Dependency: Refer to: p10017

Note: Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

02	F-DI 2 processor 2	High	Low	-

Dependency: Refer to: p9501, p9601, p10117, p10140, p10150

Note: F-DI: Failsafe Digital Input

If a safety function is assigned to an input (e.g. via p10122), then the following applies:

- logical "0": Safety function is selected
- logical "1": Safety function is de-selected

The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10140) of the input as NC contact or NO contact, and is aligned to the use of a safety function:

With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.

This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, de-selects the safety function.

With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.

This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V de-selects the safety function.

The state of parameter r10151 is delayed by one monitoring clock cycle in relation to r10051.

The parameter is only updated in the following cases:

- if the Safety Extended Functions are enabled by means of activation via F-DI.
- if transfer of the F-DIs via PROFIsafe is enabled (see p9501).

In this case only the F-DIs transferred for PROFIsafe are displayed and updated (see p10050/p10150). All F-DIs which have not been transferred have a static zero value.

The following list contains the parameters that are dependent on the command data sets.

Product: SINAMICS S120/S150, Version: 5103400, Language: eng, Type: CDS

p0641[0...n]	CI: Current limit scaling signal source / I_lim scal s_src
p0700[0...n]	Macro Binector Input (BI) / Macro BI
p0820[0...n]	BI: Drive Data Set selection DDS bit 0 / DDS select., bit 0
p0821[0...n]	BI: Drive Data Set selection DDS bit 1 / DDS select., bit 1
p0822[0...n]	BI: Drive Data Set selection DDS bit 2 / DDS select., bit 2
p0823[0...n]	BI: Drive Data Set selection DDS bit 3 / DDS select., bit 3
p0824[0...n]	BI: Drive Data Set selection DDS bit 4 / DDS select., bit 4
p0828[0...n]	BI: Motor changeover feedback signal / Mot_chng fdbk sig
p0840[0...n]	BI: ON / OFF (OFF1) / ON / OFF (OFF1)
p0844[0...n]	BI: No coast-down / coast-down (OFF2) signal source 1 / OFF2 S_src 1
p0845[0...n]	BI: No coast-down / coast-down (OFF2) signal source 2 / OFF2 S_src 2
p0848[0...n]	BI: No Quick Stop / Quick Stop (OFF3) signal source 1 / OFF3 S_src 1
p0849[0...n]	BI: No Quick Stop / Quick Stop (OFF3) signal source 2 / OFF3 S_src 2
p0852[0...n]	BI: Enable operation/inhibit operation / Enable operation
p0854[0...n]	BI: Control by PLC/no control by PLC / Master ctrl by PLC
p0855[0...n]	BI: Unconditionally release holding brake / Uncond open brake
p0856[0...n]	BI: Enable speed controller / n_ctrl enable
p0856[0...n]	BI: Enable velocity controller / v_ctrl enable
p0858[0...n]	BI: Unconditionally close holding brake / Uncond close brake
p1000[0...n]	Macro Connector Inputs (CI) for speed setpoints / Macro CI n_set
p1000[0...n]	Macro Connector Inputs (CI) for velocity setpoints / Macro CI v_set
p1020[0...n]	BI: Fixed velocity setpoint selection Bit 0 / v_set_fixed Bit 0
p1020[0...n]	BI: Fixed speed setpoint selection Bit 0 / n_set_fixed Bit 0
p1021[0...n]	BI: Fixed velocity setpoint selection Bit 1 / v_set_fixed Bit 1
p1021[0...n]	BI: Fixed speed setpoint selection Bit 1 / n_set_fixed Bit 1
p1022[0...n]	BI: Fixed velocity setpoint selection Bit 2 / v_set_fixed Bit 2
p1022[0...n]	BI: Fixed speed setpoint selection Bit 2 / n_set_fixed Bit 2
p1023[0...n]	BI: Fixed velocity setpoint selection Bit 3 / v_set_fixed Bit 3
p1023[0...n]	BI: Fixed speed setpoint selection Bit 3 / n_set_fixed Bit 3
p1035[0...n]	BI: Motorized potentiometer setpoint raise / Mop raise
p1036[0...n]	BI: Motorized potentiometer lower setpoint / Mop lower
p1039[0...n]	BI: Motorized potentiometer inversion / MotP inv
p1041[0...n]	BI: Motorized potentiometer manual/automatic / Mop manual/auto
p1042[0...n]	CI: Motorized potentiometer automatic setpoint / Mop auto setpoint
p1043[0...n]	BI: Motorized potentiometer accept setting value / MotP acc set val
p1044[0...n]	CI: Motorized potentiometer setting value / Mop set val
p1051[0...n]	CI: Velocity limit RFG positive direction / v_limit RFG pos
p1051[0...n]	CI: Speed limit RFG positive direction of rotation / n_limit RFG pos
p1052[0...n]	CI: Velocity limit RFG negative direction / v_limit RFG neg
p1052[0...n]	CI: Speed limit RFG negative direction of rotation / n_limit RFG neg
p1055[0...n]	BI: Jog bit 0 / Jog bit 0

p1056[0...n]	BI: Jog bit 1 / Jog bit 1
p1070[0...n]	CI: Main setpoint / Main setpoint
p1071[0...n]	CI: Main setpoint scaling / Main setp scal
p1075[0...n]	CI: Supplementary setp / Suppl setp
p1076[0...n]	CI: Supplementary setpoint scaling / Suppl setp scal
p1085[0...n]	CI: Velocity limit positive direction / v_limit pos
p1085[0...n]	CI: Speed limit in positive direction of rotation / n_limit pos
p1088[0...n]	CI: Velocity limit negative direction / n_limit neg
p1088[0...n]	CI: Speed limit in negative direction of rotation / n_limit neg
p1098[0...n]	CI: Skip velocity scaling / v_skip scal
p1098[0...n]	CI: Skip speed scaling / n_skip scal
p1106[0...n]	CI: Minimum velocity signal source / v_min s_src
p1106[0...n]	CI: Minimum speed signal source / n_min s_src
p1110[0...n]	BI: Inhibit negative direction / Inhib neg dir
p1111[0...n]	BI: Inhibit positive direction / Inhib pos dir
p1113[0...n]	BI: Setpoint inversion / Setp inv
p1122[0...n]	BI: Bypass ramp-function generator / Bypass RFG
p1138[0...n]	CI: Ramp-function generator ramp-up time scaling / RFG t_RU scal
p1139[0...n]	CI: Ramp-function generator ramp-down time scaling / RFG t_RD scal
p1140[0...n]	BI: Enable ramp-function generator/inhibit ramp-function generator / Enable RFG
p1141[0...n]	BI: Continue ramp-function generator/freeze ramp-function generator / Continue RFG
p1142[0...n]	BI: Enable setpoint/inhibit setpoint / Setpoint enable
p1143[0...n]	BI: Ramp-function generator, accept setting value / RFG accept set v
p1144[0...n]	CI: Ramp-function generator setting value / RFG setting value
p1155[0...n]	CI: Speed controller speed setpoint 1 / n_ctrl n_set 1
p1155[0...n]	CI: Velocity controller velocity setpoint 1 / v_ctrl v_set 1
p1160[0...n]	CI: Speed controller speed setpoint 2 / n_ctrl n_set 2
p1160[0...n]	CI: Velocity controller velocity setpoint 2 / v_ctrl v_set 2
p1201[0...n]	CI: Position offset incremental/absolute valid / x_off valid
p1201[0...n]	BI: Flying restart enable signal source / Fly_res enab S_src
p1230[0...n]	BI: Armature short-circuit / DC braking activation / ASC/DCBRK act
p1235[0...n]	BI: External armature short-circuit contactor feedback signal / ASC ext feedback
p1330[0...n]	CI: U/f control independent voltage setpoint / Uf U_set independ.
p1356[0...n]	CI: U/f control angular setpoint / Uf ang setpoint
p1430[0...n]	CI: Velocity precontrol / v_prectrl
p1430[0...n]	CI: Speed precontrol / n_prectrl
p1437[0...n]	CI: Speed controller reference model I component input / n_ctrRefMod I_comp
p1440[0...n]	CI: Speed controller speed actual value input / n_ctrl n_act
p1455[0...n]	CI: Speed controller P gain adaptation signal / n_ctr adapt_sig Kp
p1455[0...n]	CI: Velocity controller P gain adaptation signal / v_ctr adapt_sig Kp

The following list contains the parameters that are dependent on the drive data sets.

Product: SINAMICS S120/S150, Version: 5103400, Language: eng, Type: DDS

p0186[0...n]	Motor Data Sets (MDS) number / MDS number
p0187[0...n]	Encoder 1 encoder data set number / Enc 1 EDS number
p0188[0...n]	Encoder 2 encoder data set number / Enc 2 EDS number
p0189[0...n]	Encoder 3 encoder data set number / Enc 3 EDS number
p0340[0...n]	Automatic parameter calculation / Auto par calc
p0340[0...n]	Automatic calculation motor/control parameters / Calc auto par
p0345[0...n]	Required damping controlled axis / Damped ctrl axis
p0350[0...n]	Damping uncontrolled axis / Damp unctrl axis
p0351[0...n]	Piston position natural frequency minimum / Piston pos fn min
p0352[0...n]	Axis natural frequency A side / Axis fn A
p0353[0...n]	Axis natural frequency center / Axis fn center
p0354[0...n]	Axis natural frequency B side / Axis fn B
p0572[0...n]	Activate/deactivate inhibit list / Inh_list act/deact
p0578[0...n]	Calculate technology-dependent parameters / Calc tec par
p0640[0...n]	Current limit / Current limit

p0642[0...n]	Encoderless operation current reduction / Encoderl op I_red
p0644[0...n]	Current limit excitation induction motor / Imax excit ASM

Function diagrams

Parameters

Symbol	Meaning
Parameter name [Unit] rxxxx[x]	Monitoring parameter with index [x].
Parameter name [Unit] rxxxx[x...y]	Monitoring parameter with index range [x...y].
[aaaa.b] Parameter name from ... to [Unit] pxxxx[y...z] (Def)	Setting parameter (if the parameter appears a multiple number of times, then diagram references are specified).
[aaaa.b] Parameter name from ... to [Unit] pxxxx[y] (Def)	Setting parameter with index (if the parameter appears a multiple number of times, then diagram references are specified).

Connectors

Symbol	Meaning
name pxxxx (xxxx)	Connector input CI.
name pxxxx[y] (xxxx [x])	Connector input CI with index [y].
name pxxxx[y...z] (xxxx [y])	Connector input CI with index range [y...z].
name [unit] rxxxx[y...z]	Connector output CO with [dimension unit] and index range [y...z].
name [unit] rxxxx[y]	Connector output CO [dimension unit] and with index [y].

CI: Connector Input
CO: Connector Output
CO/BO: Connector/Binector Output

Binectors

Symbol	Meaning
name pxxxx (Def)	Binector input BI with factory setting (Def).
name pxxxx[y] (Def)	Binector input BI with index [y] and factory setting (Def).
name pxxxx[y...z] (Def)	Binector input BI with index range [y...z] and factory setting (Def).
name rxxxx	Binector output BO.
name rxxxx.y	Binector output BO with bit y.

BI: Binector Input
BO: Binector Output

Connectors/binectors

Symbol	Meaning
Parameter name rxxxx rxxxx	Connector/binector output CO/BO.

Cross references between diagrams

Symbol	Meaning
1 . . . 8 Signal path 1 Signal path 8 [aaaa.1] … [aaaa.8]	The function diagrams are sub-divided into 8 signal paths in order to facilitate orientation.
Text → [aaaa.b]	Text = Unique signal designation aaaa = Signal goes to target diagram aaaa b = Signal goes to signal path b
[cccc.d] → Text	Text = Unique signal designation cccc = Signal comes from source diagram cccc d = Signal comes from signal path d

To "function diagram name" [aaaa.b] = for binectors.

Cross references for control bits

Symbol	Meaning
pxxxx [aaaa.b]	pxxxx= Original parameter of signal aaaa = Signal comes from source diagram aaaa b = Signal comes from signal path b

Data sets

Symbol	Meaning
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).

Information on parameters, binectors, connectors

Symbol	Meaning
Parameter name	Parameter name (up to 18 characters).
[Unit]	[dimension unit] rotatory axis, for linear axis see list of parameters.
rxxxx[y] or rxxxx[y...z] or rxxxx[y].ww or rxxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "[y]" specifies the valid index, "[y...z]" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).
pxxxx[y] or pxxxx[y...z] or pxxxx[y].ww or pxxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "[y]" specifies the applicable index, "[y...z]" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).
from ... to	Value range.
(xxxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.
(Def)	Factory setting.
(Def.w)	Factory setting with bit number as prefix.
[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]

Sampling times

Symbol	Meaning
pxxxx[Y] (ZZZ.ZZ μs)	Setting parameter with factory setting to select the time slice.
p0115[y] (Drive Object)	Time slice depending on the pre-setting p0112 of the drive object. "[y]" specifies the applicable index.
p0115[y] (Motor Modules)	Time slice depending on the rated pulse frequency of the motor module. "[y]" specifies the applicable index.
PROFIdrive sampling time	Presetting for IF1 in p2048. Presetting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.
CAN bus sampling time	Presetting in p8848.
Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.
Not relevant	A static state is displayed here. The sampling time data is not relevant.

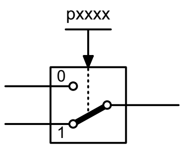
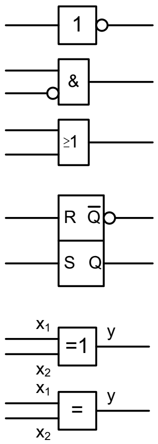
Switch symbol



Simple changeover switch

The switch position is shown according to the factory setting of pxxxx (in this case switch position 1).

Symbols for logic functions



NOT element

Logical inversion (negation).

AND element

With logical inversion of an input.

OR element

R/S flip-flop

S/R = setting input/reset input
Q = non-inverted output
$\overline{Q}$ = inverted output
With a simultaneous 1-signal at the R and S inputs, the S input dominates.

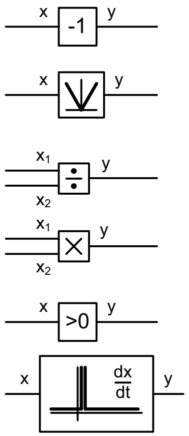
Exclusiv-OR/XOR

y = 1 when $x_1 \neq x_2$ is.

Comparator

y = 1 when $x_1 = x_2$ is.

Symbols for computational and closed-loop control functions



Sign reversal

y = -x

Absolute value generator

y = |x|

Divider

$y = \frac{x_1}{x_2}$

Multiplier

$y = x_1 * x_2$

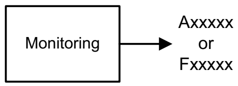
Comparator

y = 1 if the analog signal x > 0, i.e. is positive.

Differentiator

$Y = \frac{dx}{dt}$

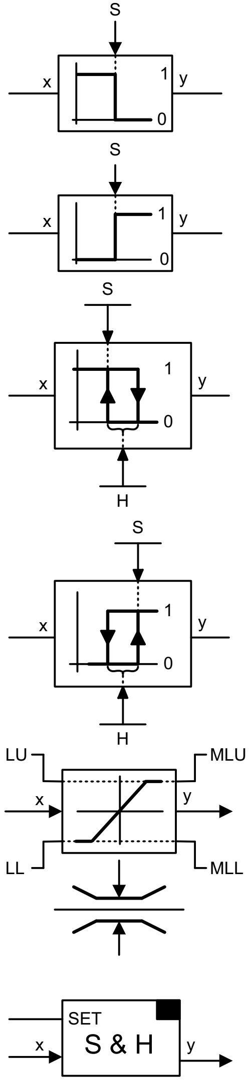
Symbol for monitoring



Monitoring

In the bottom right-hand corner of the diagram.

Symbols for computational and closed-loop control functions



Threshold value switch 1/0

Outputs at y a logical "1" if x < S.

Threshold value switch 0/1

Outputs at y a logical "1" if x > S.

Threshold value switch 1/0 with hysteresis

Outputs at y a logical "1" if x < S.

If x >= S + H, then y returns to 0.

Threshold value switch 0/1 with hysteresis

Outputs at y a logical "1" if x > S.

If x <= S – H, then y returns to 0.

Limiter

x is limited to the upper limit LU and the lower limit LL and output at y.
The digital signals MLU and MLL have the value "1", if the upper or lower limit is active.

Sample & Hold element

Sample and hold element.
y = x if SET = 1
(not saved retentively at POWER OFF)

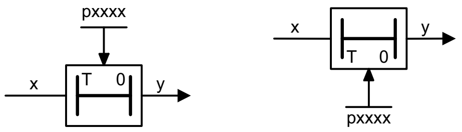
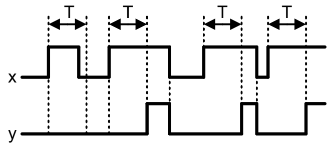
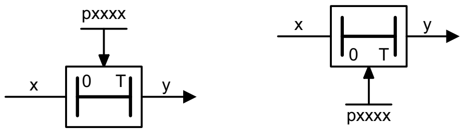
Switch-on delay



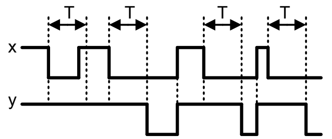
The digital signal x must have the value "1" without any interruption during the time T before output y changes to "1".



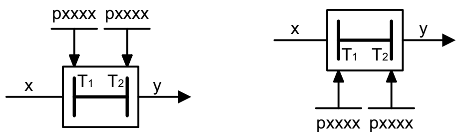
Switch-off delay



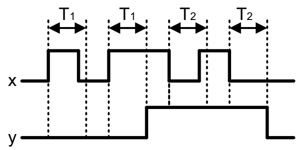
The digital signal x must have the value "0" without interruption during the time T before output y changes to "0".



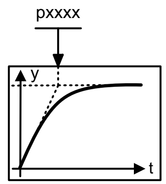
Delay (switch-on and switch-off)



The digital signal x must have the value "1" without interruption during time T_1 or must have the value "0" during time T_2 before output y changes its signal state.



PT1 element



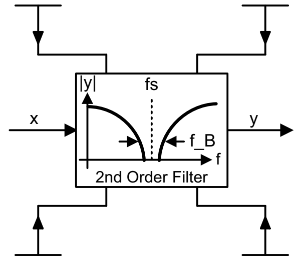
Delay element, first order.

pxxxx = time constant

2nd-order filter (bandstop/general filter)

Natural frequency, numerator
fn_n
pxxxx

Damping, numerator
D_n
pxxxx



Natural frequency, denominator
fn_d
pxxxx

Damping, denominator
D_d
pxxxx

Used as bandstop filter - center frequency fs: fn_n = fs
fn_d = fs

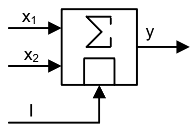
- bandwidth f_B: D_n = 0

$$D\_d = \frac{f\_B}{2 \cdot fs}$$

Transfer function when used as general filter

$$H(s) = \frac{\left(\frac{s}{2\,\pi\,fn\_n}\right)^2 + \frac{2 \cdot D\_n}{2\,\pi\,fn\_n} \cdot s + 1}{\left(\frac{s}{2\,\pi\,fn\_d}\right)^2 + \frac{2 \cdot D\_d}{2\,\pi\,fn\_d} \cdot s + 1}$$

Analog adder can be activated



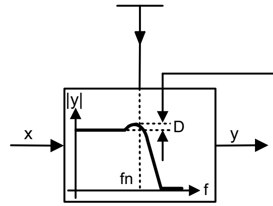
The following applies to I = 1 signal: $y = x_1 + x_2$

The following applies to I = 0 signal: $y = x_1$

PT2 low pass

Natural frequency, denominator
fn_d
pxxxx

Damping, denominator
D_d
pxxxx



Transfer function

$$H(s) = \frac{1}{\left(\frac{s}{2\,\pi\,fn\_d}\right)^2 + \frac{2 \cdot D\_d}{2\,\pi\,fn\_d} \cdot s + 1}$$

Fig. 3-4 1030 – Handling BICO technology

Handling BICO technology

Binector: r0723.15

Binectors are binary signals that can be freely interconnected (BO = Binector Output).
They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector: r0723

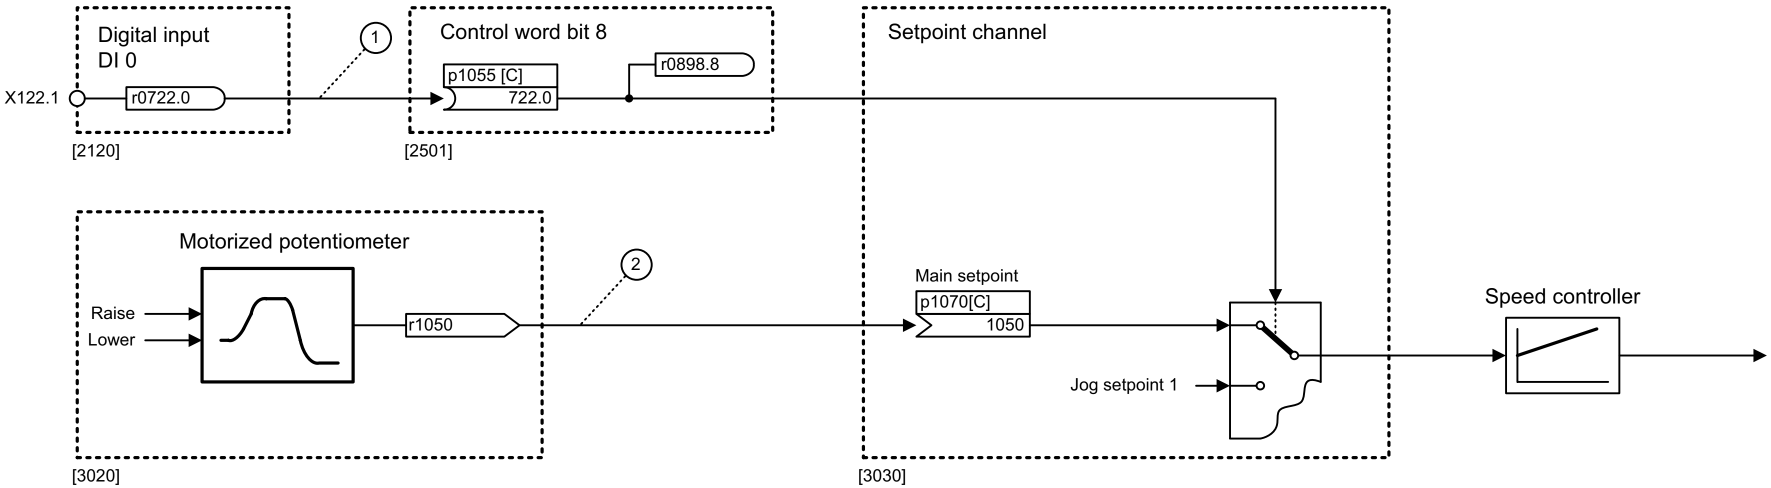
Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques).
Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:
"BI:" parameter for binectors (BI = Binector Input)
or
"CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.



Parameterizing steps:

1. p1055[0] = 722.0 Terminal X122.1 acts as "Jog bit 0".
2. p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

<1> Differential input!
In case of a ground-based input signal, the terminal X131.8 must be connected to the reference potential M.
Caution:
The voltage between an input (X131.7 or X131.8) and the grounding point must not exceed 35 V.
When the load resistor is switched in (S5.0 closed), the voltage between the input terminals must not exceed 15 V.

<1> The drive object CU_LINK only exists for automation systems with SINAMICS Integrated (e.g. SIMOTION D, SINUMERIK NCU) and the corresponding controller extension (e.g. CX32-2, NX10).
On the SINAMICS Integrated, each controller extension is represented by a drive object CU_LINK.

<2> p8800: CU_LINK address.
Address of the controller extension, represented by the drive object CU_LINK. The address correlates with the DRIVE-CLiQ socket of the Control Unit connected/configured to the controller extension configured.
Value range: See p0918 (PROFIBUS address)
The parameter p8800 is only readable through non-cyclic parameter access via DPV1 services.

The arrangement of process data (PZD) for the supplementary telegram 700/701/750 depends on the telegram selection (p0922, p2079) and the receive and send words reserved (p2070, p2071).

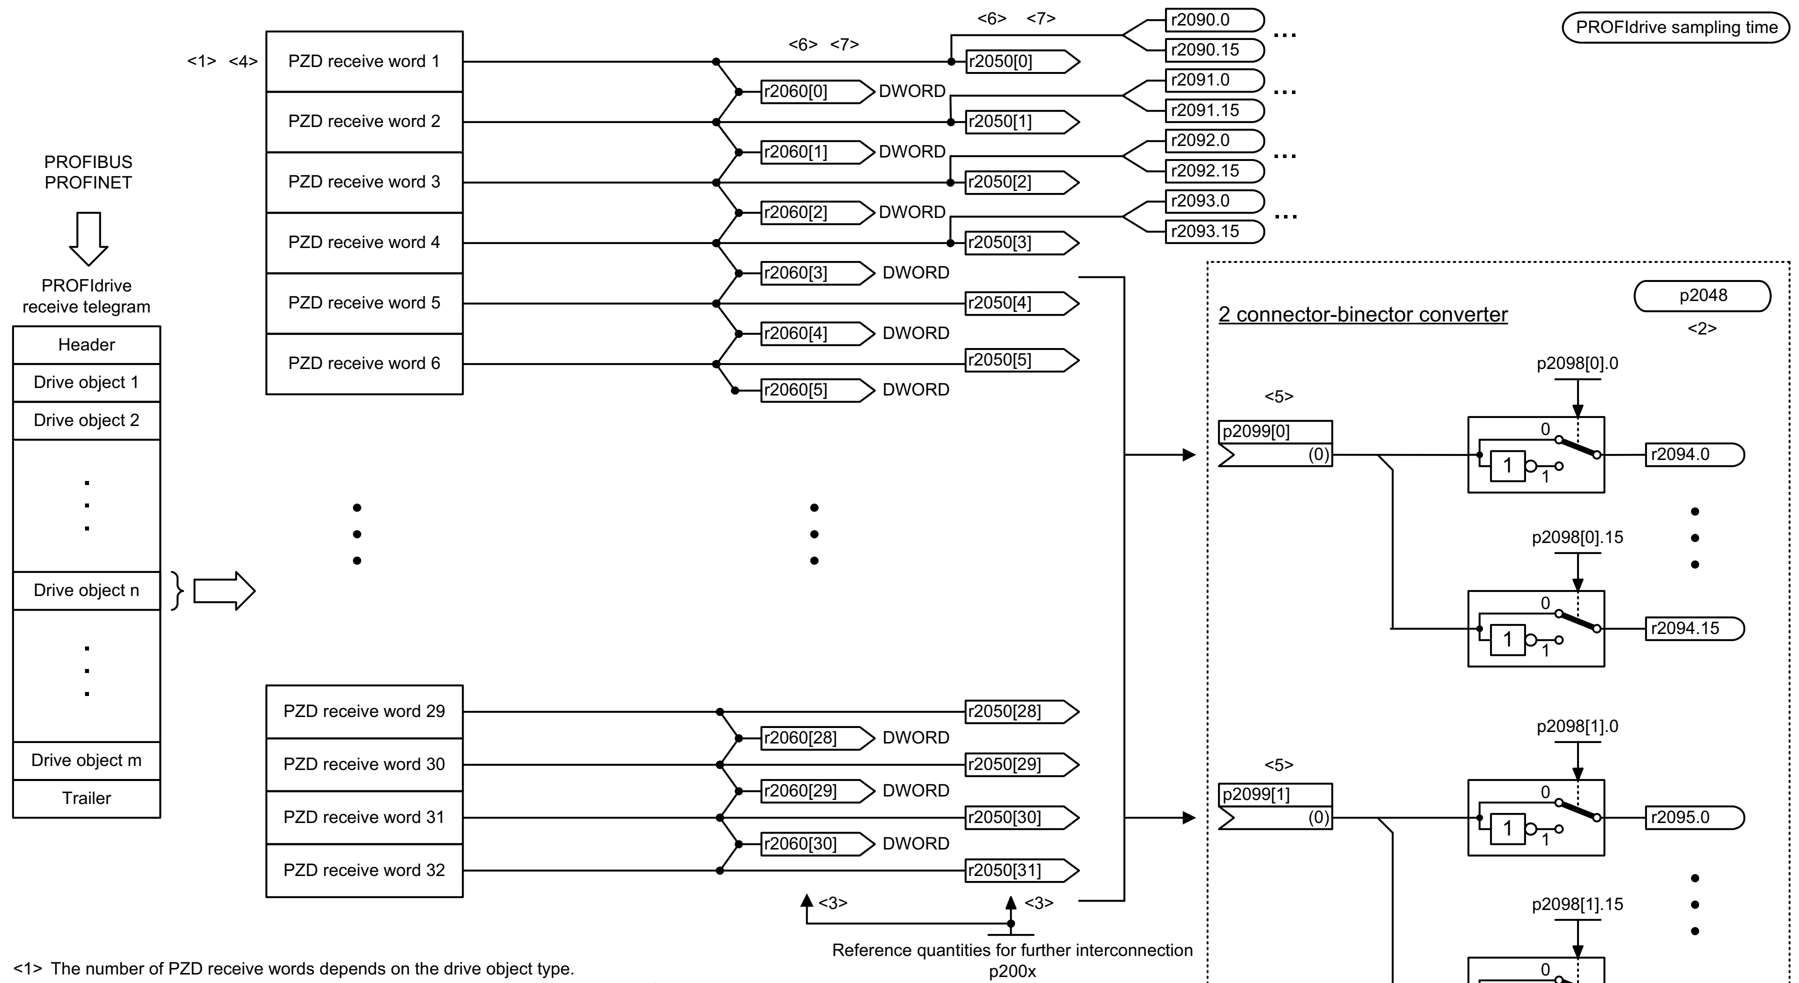
Fig. 3-73 2468 – IF1 receive telegram, free interconnection via BICO (p0922 = 999)



<1> The number of PZD receive words depends on the drive object type.
<2> The connector-binector converter only converts the lower 16 bits irrespective of the input variable.
<3> The following representation applies for words: 4000 hex = 100 % for double words 4000 0000 hex = 100 %.
The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).
The following applies for temperature values: 100 °C -> 100 % = 4000 hex or 4000 0000 hex; 0 °C -> 0 %.
<4> In order to maintain the PROFIdrive profile, receive word 1 must be used as control word (STW1) (due to bit 10 "control requested").
<5> Using the connector-binector converters, the bits can be extracted from two of the PZD receive words 5 to 32 and used as binectors.
<6> Every PZD word can be assigned a word or a double word. Only one of the 2 interconnection parameters r2050 or r2060 can have a value ≠ 0 for a PZD word.
<7> When interconnecting a connector output multiple times all the connector inputs must have either Integer or FloatingPoint data type.

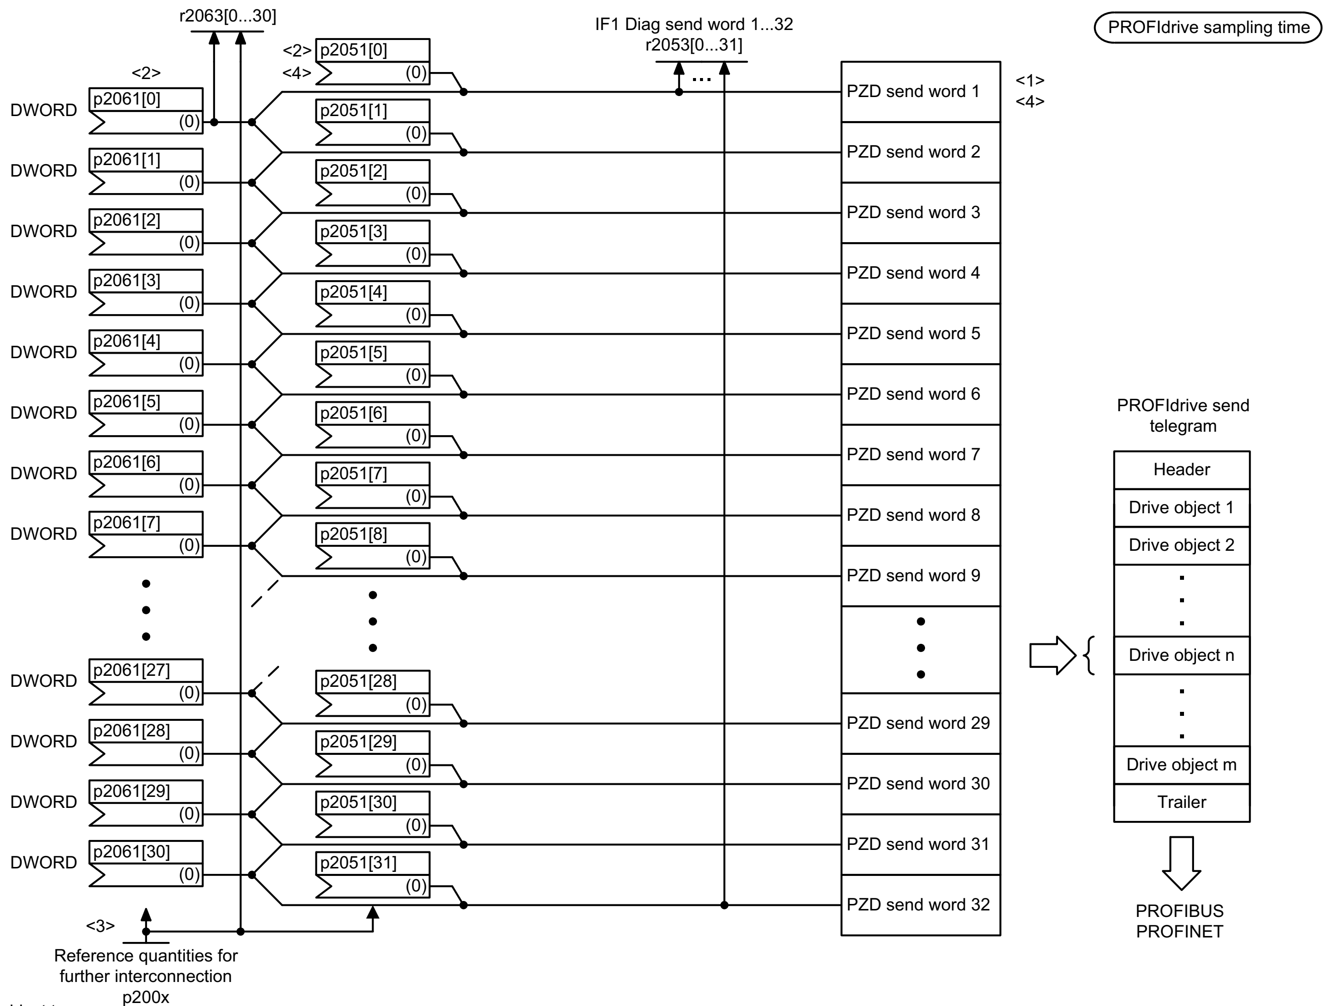
Fig. 3-74 2470 – IF1 send telegram, free interconnection via BICO (p0922 = 999)



<1> The number of PZD send words depends on the drive object type.
<2> A PZD send word can either be supplied via connector input p2051[x] (WORD) or via p2061[x] (DWORD).
The two corresponding connector inputs cannot be interconnected.
<3> Physical word and double word values are inserted in the telegram as referenced variables. p200x apply as reference variables (telegram contents = 4000 hex or 4000 0000 hex in the case of double words, if the input variable has the value p200x).
The following applies for temperature values: 100° C -> 100 % = 4000 hex or 4000 0000 hex; 0° C -> 0 %.
<4> To comply with the PROFIdrive profile, send word 1 must be used as status word 1 (ZSW1), not as DWORD.

<1> The number of PZD receive words depends on the drive object type.
<2> The connector-binector converter only converts the lower 16 bits irrespective of the input variable.
<3> The following representation applies for words: 4000 hex = 100 % for double words 40000 0000 hex = 100 %.
The reference variables p200x apply for the ongoing interconnection (100 % -> p200x).

<1> STW1.10 must be set to ensure that the drive object accepts the process data (PZD).
<2> Only for telegram 220.
<3> When the master control is retrieved, predefined by commissioning tool or AOP30.
<4> Only applies if the function module "Extended brake control" (r0108.14 = 1) is active.
<5> For drive object ENC only bit 10.
<6> PROFIdrive interconnection:
For PROFIdrive standard telegrams, the upper inputs are connected with PROFIdrive-STW1 ([2415], [2416]). Only relevant for CDS0.

<1> The drive object is ready to accept data.
<2> Only for Telegram 220.
<3> These signals are only relevant if the "extended brake control" function module is active (r0108.14 = 1).
<4> If "Safe Brake Control" (SBC) is activated and selected, the brake is no longer controlled via this signal.
<5> Only with message frame 220 and activated function module "Extended brake control" (r0108.14 = 1), otherwise hard wiring set to 1.
<6> For DO ENC only bit 9.

If a DO Infeed (A_INF, B_INF and S_INF) is used, it closes the line contactor (refer to [8732], [8832], [8932]) and not the DO SERVO/VECTOR.
<4> These control commands can also be triggered by a fault response.

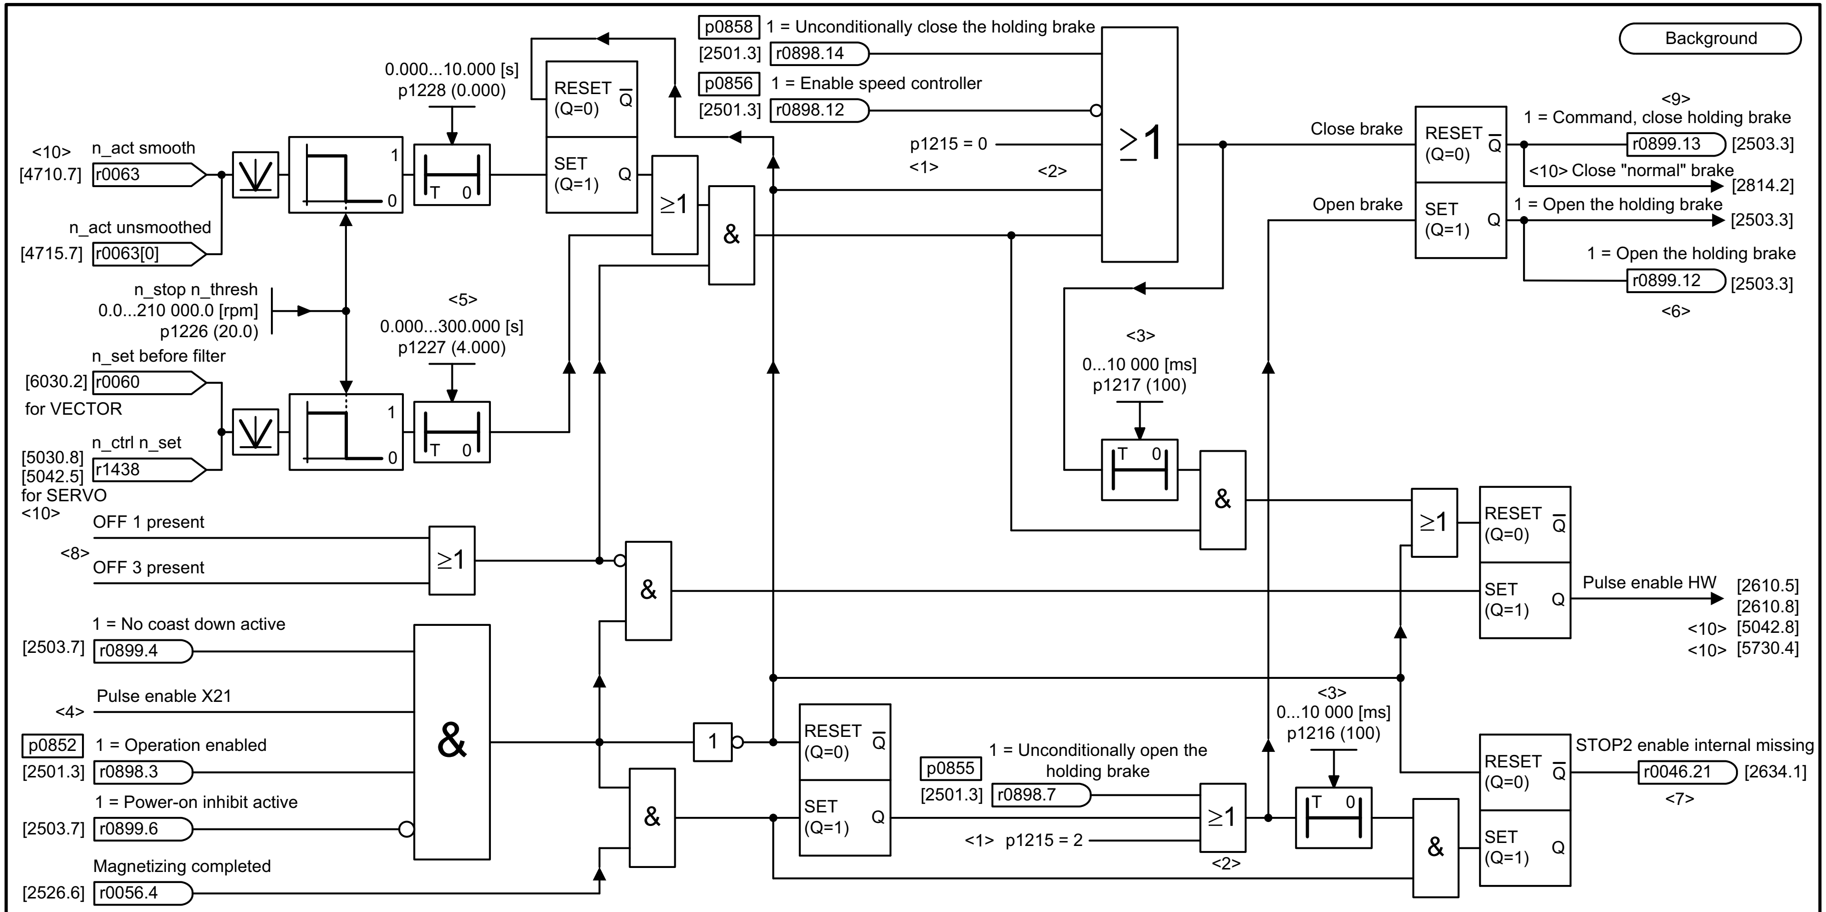
3.12 Brake control

Function diagrams

Fig. 3-107 2701 – Basic brake control (r0108.14 = 0)



<1> Motor holding brake configuration (p1215)
0 = No motor holding brake being used.
1 = Motor holding brake acc. to sequence control.
2 = Motor holding brake always released.
3 = Motor holding brake like sequence control, connection via BICO.
<2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
<3> If p1215 = 0, 2 -> t = 0 ms.
<4> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
<5> For p1227 = 300 s, the monitoring function is deactivated.
<6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
<7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or power-on inhibit).
The signal generation is shown simplified.
<8> The internal signal includes signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
<9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.
<10> Only for SINAMICS S120.

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay). <10>
Note: With VECTOR with activated "parallel circuit" Function Module (r0108.15 = 1), the holding brake may only be connected to a power unit (p7015).

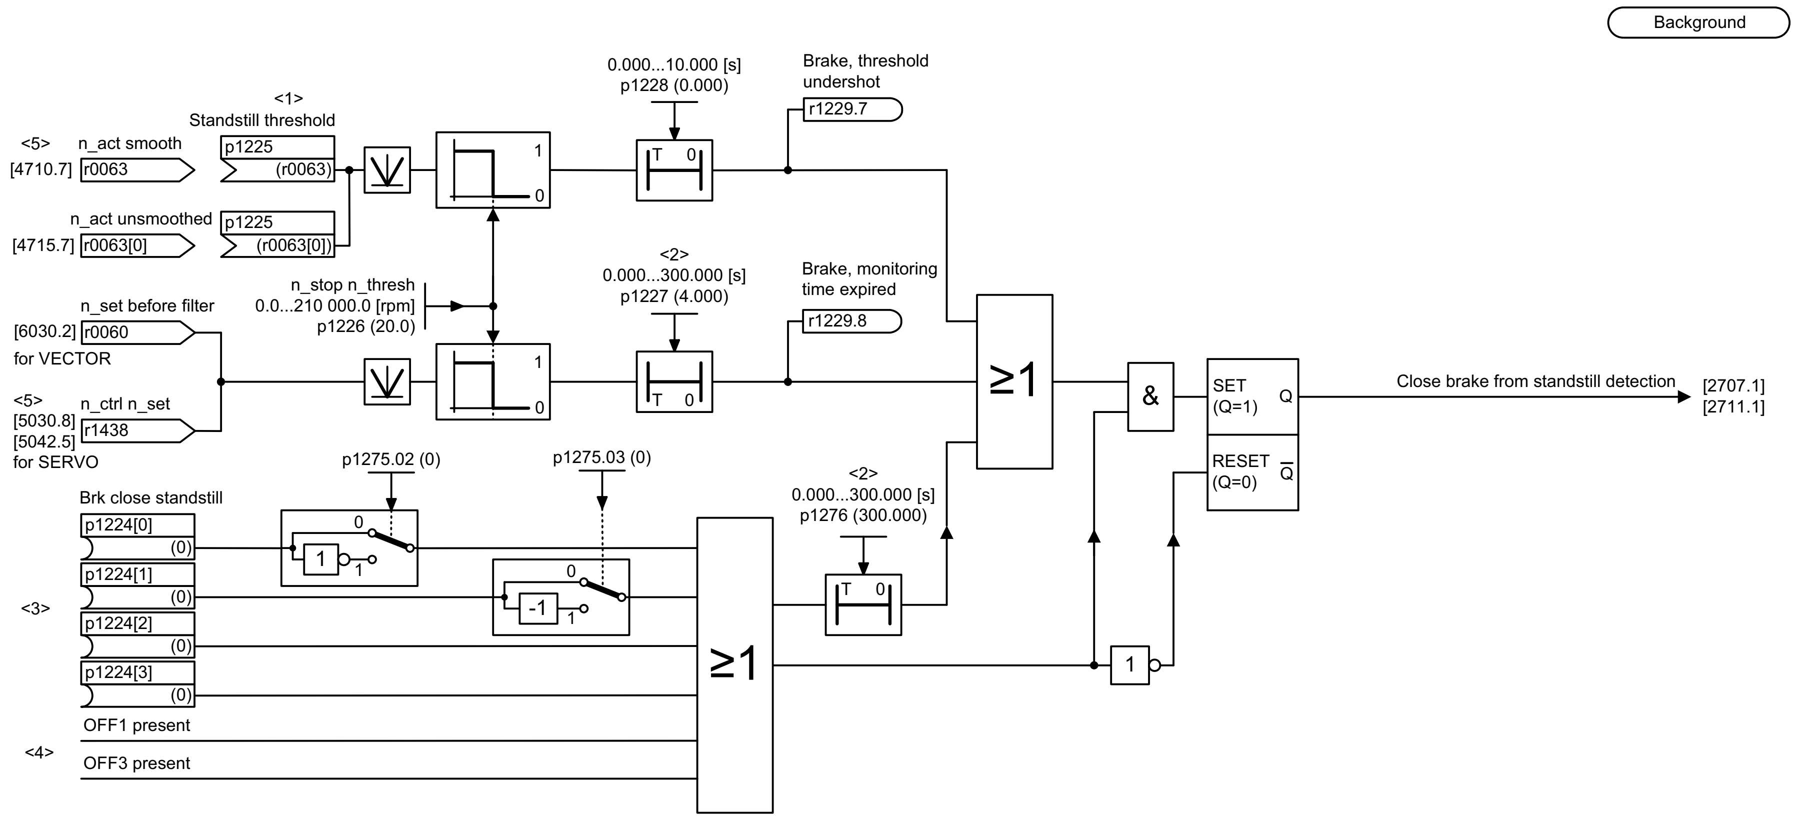
Fig. 3-108 2704 – Extended brake control, zero-speed detection (r0108.14 = 1)



<1> Shutdown threshold of the standstill detection. In this case (e.g. when using a brake), another criterion than the speed actual value can be selected to clear the pulses. Otherwise, we recommend to keep the factory setting.
<2> For p1276 = 300.000 s, the timer is deactivated, i.e. the timer output is always 0. Note: When operating a motor with a brake which must not be applied while the motor is rotating, the monitoring time of both timers must be set to 300 s.
<3> For operation without brake, p1224[0...3] must be 0 (factory setting) in order to avoid undesirable interaction with the sequence control.
<4> The internal signal comprises signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
<5> Only for SINAMICS S120.

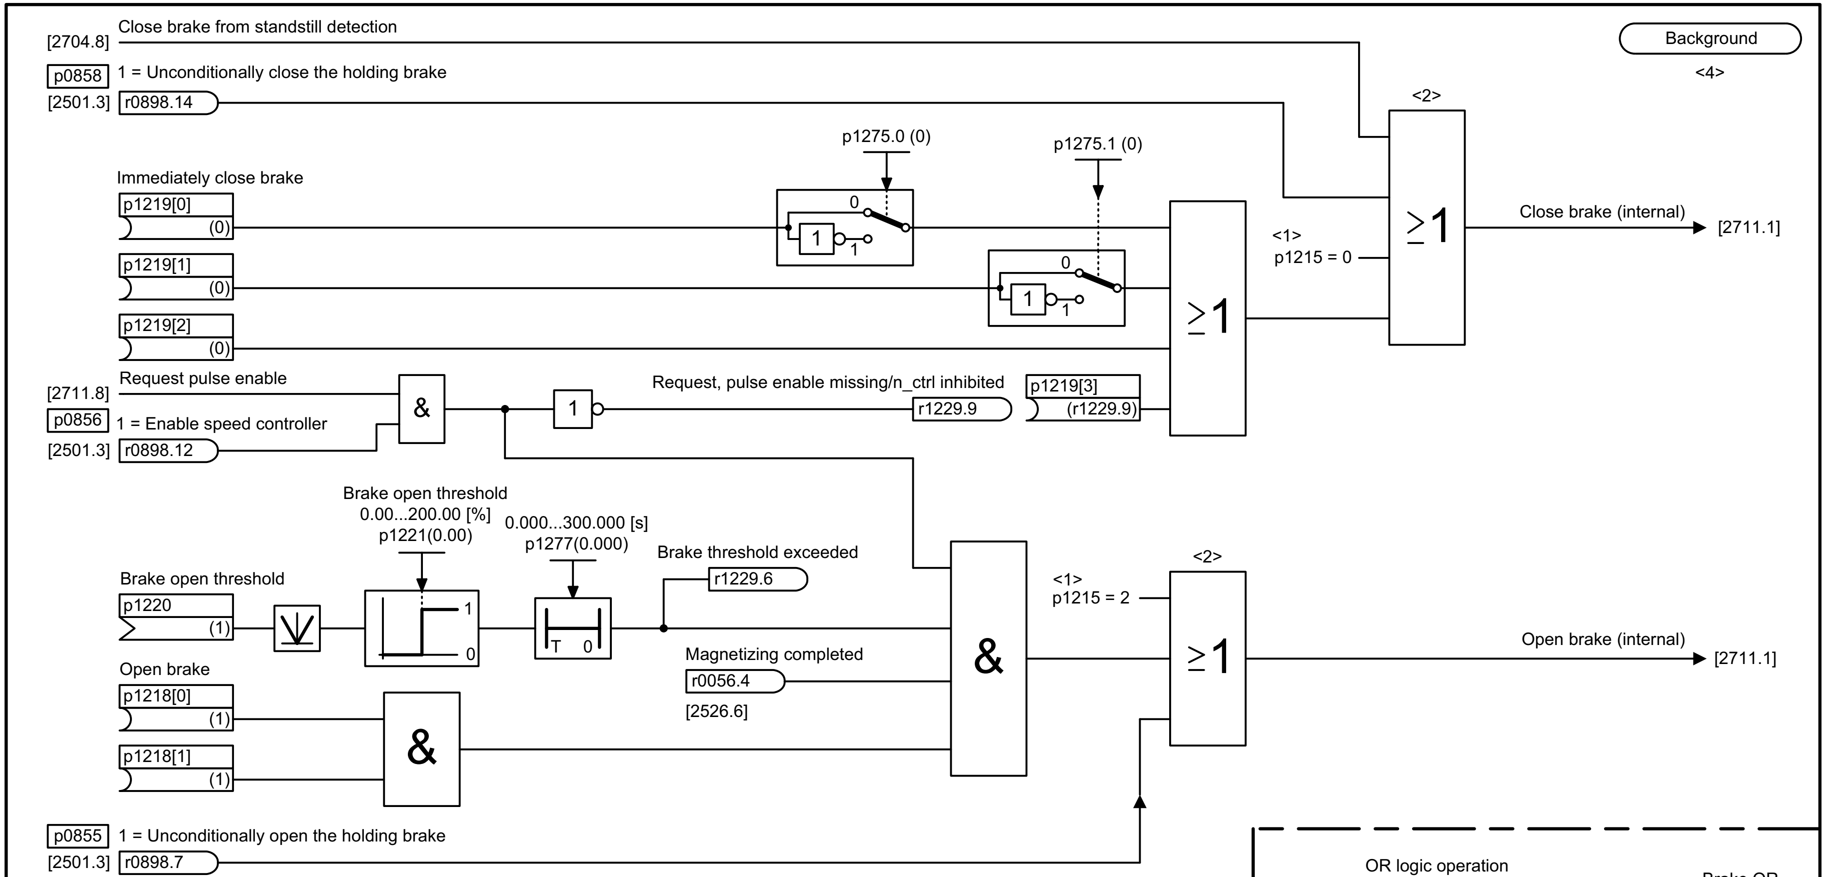
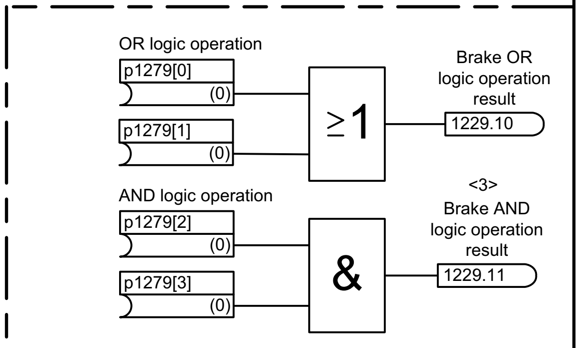
Brake control - Extended brake control, zero-speed detection (r0108.14 = 1)	27.06.13 V05.01.01	S120/S150/G130/G150	





<1> Motor holding brake configuration
0 = No brake or brake always applied (brake connected to the power unit)
1 = Brake control active (brake connected to the power unit)
2 = Brake always released (brake connected to the power unit)
3 = Brake control active (brake connection can be interconnected using BICO)
Note:
A motor brake cannot be connected to all power units. p1215 is set to 3 and the brake is controlled via a digital output (e.g. TM31).
<2> Priority assignment (high -> low): p1215, p0858, p0855, p0856/p1219, apply brake from standstill detection, p1218.
<3> These blocks/modules are evaluated with the same sampling rate as the brake control and therefore may only be used to individually adapt the brake control.
<4> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait until the brake is released or applied.

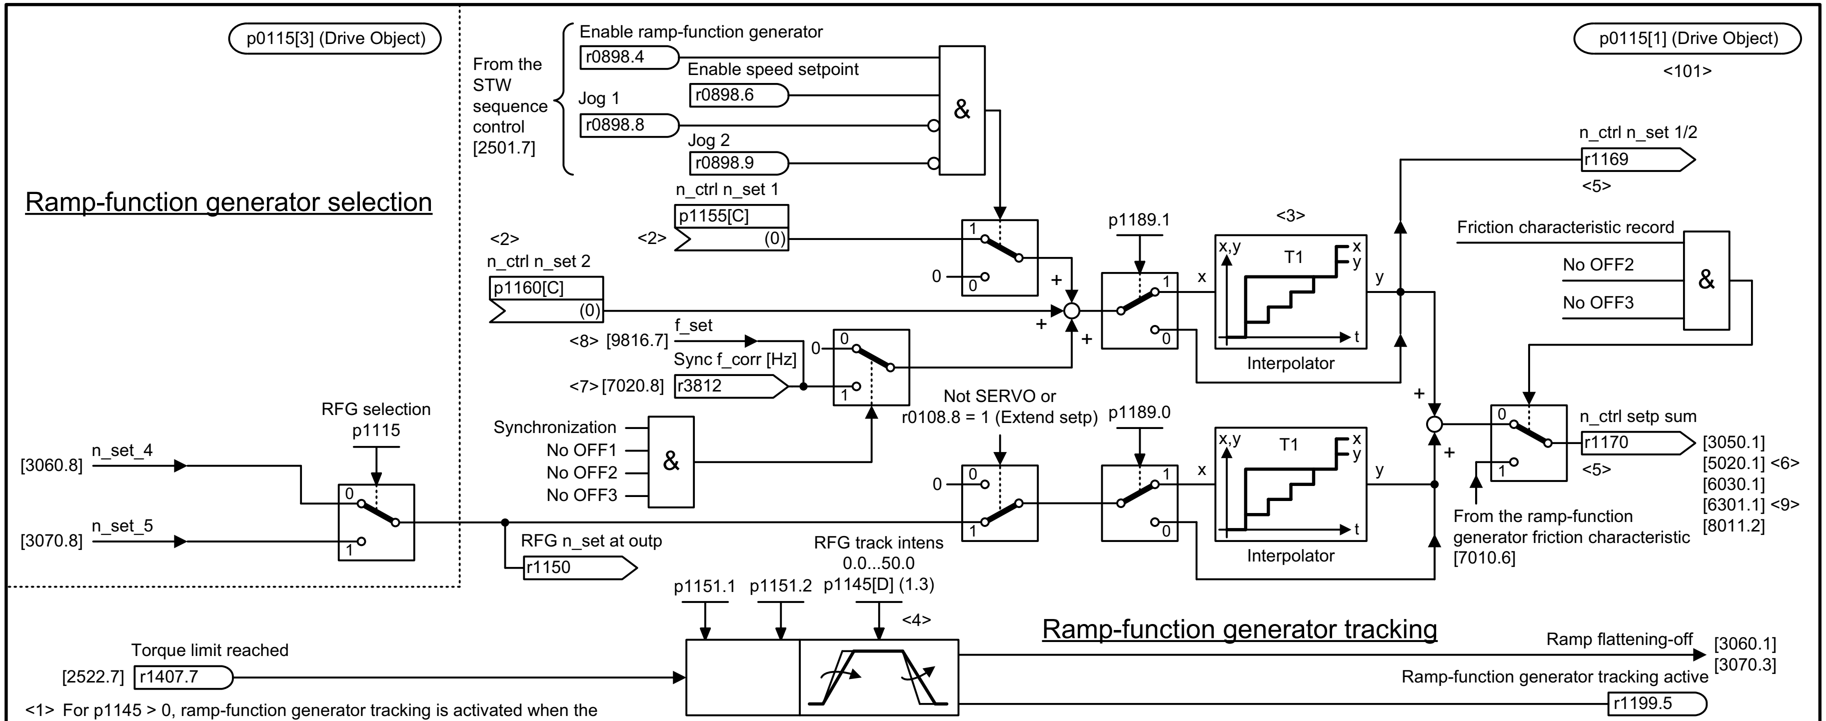
Fig. 3-162 3080 – Ramp-function generator selection, status word, tracking



<1> For p1145 > 0, ramp-function generator tracking is activated when the torque limiting responds. This means that the speed controller output only exceeds the torque limit by a deviation that can be set via p1145.

<2> For OFF1/OFF3, the ramp-function generator ramp is active. The ramp-function generator is set (SERVO: to the actual value, VECTOR, VECTOR3P, VECTORGL, VECTORMV, VECTORSL: to the setpoint (r1170)) and stops the drive with the ramp-downtime (p1121 or p1135). STW1.4 (enable ramp-function generator) is effective while the drive is stopped via the ramp-function generator. Depending on the p1115, the basic ramp-function generator [3060] or the extended ramp-function generator [3070] is effective.
For SERVO is valid: When the function module "extended setpoint channel" is not active (r0108.8 = 0), for OFF1/OFF3 the down ramp of the basic ramp-function generator is effective (refer to n_set_4 on [3060.8]).

<3> The interpolator is only active with activated "basic positioner" Function Module or with isochronous PROFIdrive mode and sign of life received by the master (STW2.12 ... STW2.15).

<4> Behavior of the response ramp of the torque limiting:
p1145 = 0.0: No ramp-function generator tracking. The ramp-function generator ramp is no longer in the range of the speed actual value.
p1145 = 1.0: The ramp-function generator ramp remains as close as possible to the speed actual value.
p1145 > 1.0: The ramp-function generator ramp is steeper than for p1145 = 1.0 (higher "speed following error").

<5> The value is displayed correctly only with r0899.2 = 1 (Operation enabled).

<6> For SERVO only.

<7> For VECTOR, VECTOR3P, VECTORMV only.

<8> For VECTORGL only.

<9> For VECTOR3P, VECTORM2C, VECTORMV, VECTORSL only.

<1> Principle of operation of Dynamic Servo Control (DSC): The feedback branch {2} completely compensates the feedback coupling branch {1} in respect of the position actual value sent from the drive. The fast actual value channel {3} allows for a high dynamic performance and high Kv factors.
<2> For the motor encoder (p1192 = 1) p1193 = 1 is effective.
When using encoder 2 or 3 (p1192 = 2, 3), p1193 corresponds to the "Increments per motor encoder revolution/increments of the encoder selected (2, 3) during one motor rotation" (considering gear ratios and also different encoder lines and fine resolutions).
<3> The deadtime for the PROFIdrive data transfer is set automatically.
<4> The position deviation must be referred to the increments of the motor including the fine resolution.
<5> Normalization of KPC: If signal Δx = 1 motor revolution and KPC = 1, then "n_set from DSC" = 0.001 motor revolutions/s.
<6> Clock-synchronous operation must be active for DSC.
<7> Only for p1400.17 = 1 and at limitation becomes p1407.19 = 1.
<8> With active symmetrization (T_SYMM > 0), the speed feedforward value is balanced using the sum of the following time constants:
T_SYMM (refer to p1195) +
T_SYMM_ADD (p1427) + 0.5 *
T_Speed controller (p0115[1]).
<9> It is actualised with every DRIVE-CLiQ base tact.

<1> For p0115[1] = p0115[0], the interpolator is automatically jumpered (bypassed) independently of the control.
<2> As for torque reduction (e.g. for "Travel to fixed stop (TfS)" with process data MOMRED), see PROFIdrive telegrams 102 ... 106 [2419].
<3> Injecting an additional torque via p1569 is to be provided only for the friction characteristic, since this torque setpoint input dynamically changes the torque limits to ensure a symmetrical control behavior (see [5650]).

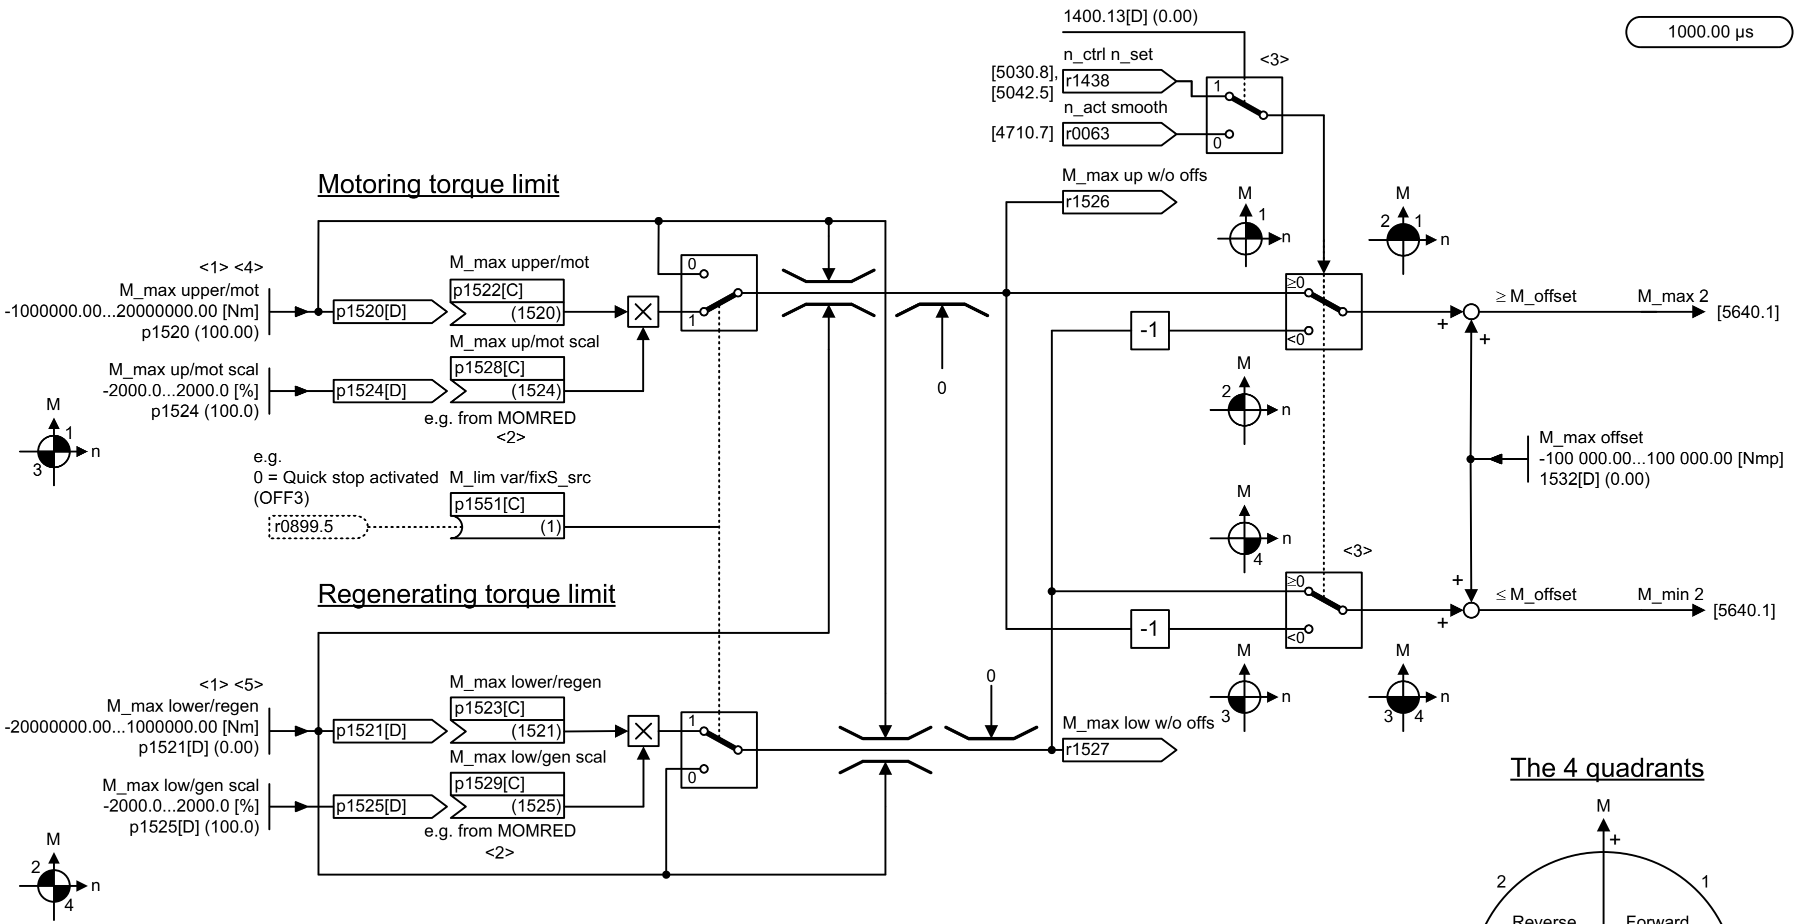
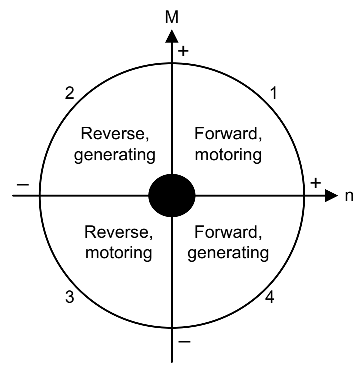
Fig. 3-220 5620 – Motoring/generating torque limit



The 4 quadrants



<1> For p1400.4 = 1, the first torque limit applies for motoring operation and the other for regenerative operation, independently of the sign of the torque and the speed (compatible with SIMODRIVE).
"Normal case": If neither dynamic limits nor offsets are required, the torque limit when motoring is entered via p1520. The torque limit when regenerating is entered via p1521 (as a negative value).

<2> For the manufacturer-specific PROFIdrive telegrams 102 … 106, r1543 is entered here [5610.4].

<3> With p1400.13 = 0, the following applies: if n_act < p1546, the motor limit is effective.
With p1400.13 = 1, the following applies: if n_set = 0, the regenerative limit is effective.

<4> The following applies to p0543 ≠ 0: The minimum value from p1520 and p0543 is used for further calculation.

<5> The following applies to p0543 ≠ 0: The minimum value from p1521 and negated p0543 is used for further calculation.

<1> For p1400.4 = 0 the torque limits for the positive and negative torque direction (upwards and downwards) are compatible with MASTERDRIVES and MICROMASTER 4.
"Normal case": If neither dynamic limits nor offsets are required, the upper torque limit is entered via p1520 and the lower via p1521 (as a negative value).

<2> Danger: Negative values at (A) or positive values at (B) represent a minimum torque for the other torque direction and can cause the motor to accelerate uncontrollably.

<3> The limiter ensure that the limits do not mutually "overtake" one another. With (A) < (B), Fault F07090 is initiated.

<4> For the manufacturer-specific PROFIdrive telegrams 102 ... 106, r1543 is switched in here [5610.4].

<5> The following applies to p0543 ≠ 0: The minimum value from p1520 and p0543 is used for further calculation.

<6> The following applies to p0543 ≠ 0: The minimum value from p1521 and negated p0543 is used for further calculation.

<1> For KTY, PT100, PT1000 and PTC, the value p0606 = 0 has a different meaning:
KTY, PT100, PT1000: 0 ≙ The output of the timer is always switched out (logical 0)
PTC: 0 ≙ Delay time = 0 s
<2> The switch-in delay p0607 = 0 suppresses fault F07016.
<3> For KTY, PT100, PT1000 and "No sensor", temperature as defined in the model.
<4> Motor temperature model 1/3: A07012, Motor temperature model 2: A07910
<5> Only for p0610 = 1.
<6> Applies only for VECTOR.
<7> p0606 does not work for alarms via p0616.
<8> Only for motors with DRIVE-CLiQ.
<9> p0601 = 5 can only be evaluated if r0192.15 = 1 and p0600 = 11; PT100 is calibrated via p0624.
<10> The assignment of temperature channels 1 … 4 depends on the hardware used.
<11> The relevant rated response temperature (°C) depends on the temperature sensor chosen by the motor manufacturer.

Content

4.1 Overview of faults and alarms

4.1.1 General information

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Online via the commissioning software
- Display and operating unit (e.g. BOP, AOP)

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	What happens when a fault occurs? • The appropriate fault reaction is initiated • Status signal ZSW1.3 is set. • The fault is entered into the fault buffer. How are faults eliminated? • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	What happens when an alarm occurs? • Status signal ZSW1.7 is set. • The alarm is entered into the alarm buffer. How are alarms eliminated? • Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.

Fault reactions

Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	No reaction when a fault occurs, **Note** When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.
OFF1	ON/ OFF	Brake along the ramp-function generator down ramp followed by pulse inhibit	**Closed-loop speed control (p1300 = 20, 21)** • n_set = 0 is input immediately to brake the drive along the ramp-function generator ramp down (p1121). • When zero speed is detected, the motor holding brake (if parameterized) is closed (p1215). The pulses are suppressed when the brake application time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired. **Torque control (p1300 = 23)** • The following applies for torque control: Reaction as for OFF2. • When the system switches to torque control with p1501, the following applies: No separate braking reaction. If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake application time (p1217) expires.
OFF1_ DELAYED	-	As for OFF1, however delayed	Faults with this fault response only become effective after the delay time in p3136 has expired. The remaining time up to OFF1 is displayed in r3137.
OFF2	COAST STOP	Internal/external pulse inhibit	**Closed-loop speed and torque control** • Instantaneous pulse suppression, the drive "coasts" to a standstill. • The motor holding brake (if one is being used) is closed immediately. • Switching on inhibited is activated.

Table 4-2 Fault reactions, continued

List	PROFIdrive	Reaction	Description
OFF3	QUICK STOP	Braking along the OFF3 down ramp followed by pulse inhibit	**Closed-loop speed control (p1300 = 20, 21)** • n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). • When zero speed is detected, the motor holding brake (if parameterized) is closed. The pulses are suppressed when the closing time of the holding brake (p1217) expires. Zero speed is detected if the actual speed drops below the threshold (p1226) or if the monitoring time (p1227) started when the speed setpoint <= speed threshold (p1226) has expired. • Switching on inhibited is activated. **Torque control (p1300 = 23)** • Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.
STOP2	-	n_set = 0	• n_set = 0 is input immediately to brake the drive along the OFF3 ramp down (p1135). • The drive remains in closed-loop speed control.
IASC/ DCBRK	-	-	• For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal armature short-circuit is triggered. The conditions for p1231 = 4 must be observed. • For induction motors, the following applies: If a fault occurs with this fault reaction, DC braking is triggered. DC braking must have been commissioned (p1232, p1233, p1234).
ENCODER	-	Internal/external pulse inhibit (p0491)	The fault reaction ENCODER is applied as a function of the setting in p0491. Factory setting: p0491 = 0 --> Encoder fault causes OFF2 **Notice** When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Table 4-3 Acknowledging faults

Acknowledgment	Description
POWER ON	The fault is acknowledged using POWER ON (switch drive unit off and on again). **Note** If this action has not removed the fault cause, the fault is displayed again immediately after power up.
IMMEDIATELY	Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (Point 4) as follows: 1 Set acknowledgment by parameter: p3981 = 0 --> 1 2 Acknowledging via binector inputs: p2103 BI: 1 Acknowledge faults p2104 BI: 2 Acknowledge faults p2105 BI: 3 Acknowledge faults 3 Acknowledging using a PROFIDRIVE control signal: STW1.7 = 0 --> 1 (edge) 4 Acknowledge all faults p2102 BI: Acknowledge all faults All of the faults on all of the drive objects of the drive system can be acknowledged using this binector input. **Note** • These faults can also be acknowledged by a POWER ON. • If the cause of the fault has not been removed, the fault will continue to be displayed after acknowledgment. • Safety Integrated faults The "Safe Torque Off" (STO) function must be deselected before these faults are acknowledged.
PULSE INHIBIT	The fault can only be acknowledged when the pulses are inhibited (r0899.11 = 0). The same options are available for acknowledging as described under acknowledge IMMEDIATELY.

4.1.2 Explanation of the list of faults and alarms

The data in the following example have been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 2489) has the following layout:

- - - - - - - - - - - - Start of example -

Axxxxx (F, N)	**Fault location (optional): Name**		
Message value:	Component number: %1, fault cause: %2		
Message class:	Text of the message class (number according to PROFIdrive)		
Drive object:	List of objects.		
Component:	Control Unit (CU)	**Propagation:**	GLOBAL
Reaction:	NONE		
Acknowledgement:	NONE		
Cause:	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).		
Remedy:	Description of possible remedies.		
Response to F:	A_INFEED: OFF2 (OFF1, NONE) SERVO: NONE (OFF1, OFF2, OFF3) VECTOR: NONE (OFF1, OFF2, OFF3)		
Acknowl. upon F:	IMMEDIATELY (POWER ON)		
Response upon N:	NONE		
Acknowl. upon N:	NONE		

- - - - - - - - - - - - End of example -

Axxxxx	**Alarm xxxxx**
Axxxxx (F, N)	**Alarm xxxxx (message type can be changed to F or N)**
Fxxxxx	**Fault xxxxx**
Fxxxxx (A, N)	**Fault xxxxx (report type can be changed to A or N)**
Nxxxxx	**No message**
Nxxxxx (A)	**No message (message type can be changed to A)**
Cxxxxx	**Safety message (separate message buffer)**

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information on reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms" (Page 2489) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 2482)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)

  Specifies the "Channel error type" of the PROFINET channel diagnostics.

  When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.

- DS1 (dec)

  Specifies the bit number in date set DS1 of the diagnostic alarm for SIMATIC S7.

  When the diagnostic alarms are activated, the texts listed in the table can be displayed.

- DP (dec)

  Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.

  When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

- ET 200 (dec)

  Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.

  When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.
- NAMUR (r3113.x)

  Specifies the bit number in parameter r3113.

For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Component

Type of hardware component that has triggered the fault or alarm.

With "Component: None" it is not possible to assign the message to a hardware component.

Propagation

In the case of faults that are, for example, triggered by the Control Unit or a Terminal Module, central functions of the drive are also often affected. Using propagation, faults that are triggered by one drive object are therefore passed on to other drive objects.

There are the following types of propagation:

- BICO

  The fault is passed on to all active drive objects with closed-loop control functions (infeed, drive) to which there is a BICO interconnection.

- DRIVE

  The fault is passed on to all active drive objects with closed-loop control functions.

- GLOBAL

  The fault is passed on to all active drive objects.

- LOCAL

  The response of this type of propagation is dependent on parameter p3116.

  With binector input p3116 = 0 (factory setting) the following applies:
  The fault is passed on to the first active drive object with closed-loop control functions.

  With binector input p3116 = 1-signal, the following applies:
  The fault is not passed on.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 2477)

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults" (Page 2479)

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0..63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0..7] and specifies additional, more precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

⚠ **WARNING**
On a case for case basis, service and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

4.1.3 Number ranges of faults and alarms

Note

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 2489).

Faults and alarms are organized into the following number ranges:

F01000 Internal software error

Message value: Module: %1, line: %2
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: POWER ON
Cause: An internal software error has occurred.
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Remedy: - evaluate fault buffer (r0945).
- carry out a POWER ON (switch-off/switch-on) for all components.
- if required, check the data on the non-volatile memory (e.g. memory card).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

F01001 FloatingPoint exception

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: POWER ON
Cause: An exception occurred during an operation with the FloatingPoint data type.
The error may be caused by the basic system or a technology function (e.g. FBLOCKS, DCC, TEC).
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Note:
Refer to r9999 for further information about this fault.
r9999[0]: Fault number.
r9999[1]: Program counter at the time when the exception occurred.
r9999[2]: Cause of the FloatingPoint exception.
Bit 0 = 1: Operation invalid
Bit 1 = 1: Division by zero
Bit 2 = 1: Overflow
Bit 3 = 1: Underflow
Bit 4 = 1: Inaccurate result
Remedy: - carry out a POWER ON (switch-off/switch-on) for all components.
- check configuration and signals of the blocks in FBLOCKS.
- check configuration and signals of DCC charts.
- check configuration and signals of TEC charts.
- upgrade firmware to later version.
- contact Technical Support.

F01005	**Firmware download for DRIVE-CLiQ component unsuccessful**
Message value:	Component number: %1, fault cause: %2
Message class:	Hardware/software error (1)
Drive object:	All objects
Component:	None **Propagation:** LOCAL
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	It was not possible to download the firmware to a DRIVE-CLiQ component. Fault value (r0949, interpret hexadecimal): yyxxxx hex: yy = component number, xxxx = fault cause xxxx = 000B hex = 11 dec: DRIVE-CLiQ component has detected a checksum error. xxxx = 000F hex = 15 dec: The selected DRIVE-CLiQ component did not accept the contents of the firmware file. xxxx = 0012 hex = 18 dec: Firmware version is too old and is not accepted by the component. xxxx = 0013 hex = 19 dec: Firmware version is not suitable for the hardware release of the component. xxxx = 0065 hex = 101 dec: After several communication attempts, no response from the DRIVE-CLiQ component. xxxx = 008B hex = 139 dec: Initially, a new boot loader is loaded (must be repeated after POWER ON). xxxx = 008C hex = 140 dec: Firmware file for the DRIVE-CLiQ component not available on the memory card. xxxx = 008D hex = 141 dec: An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example. xxxx = 008F hex = 143 dec: Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware. xxxx = 0090 hex = 144 dec: When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective. xxxx = 0091 hex = 145 dec: Checking the loaded firmware (checksum) was not completed by the component in the appropriate time. xxxx = 009C hex = 156 dec: Component with the specified component number is not available (p7828). xxxx = Additional values: Only for internal Siemens troubleshooting.
Remedy:	- check the selected component number (p7828). - check the DRIVE-CLiQ wiring. - save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/". - use a component with a suitable hardware version - after POWER ON has been carried out again for the DRIVE-CLiQ component, download firmware again. Depending on p7826, the firmware will be automatically downloaded.

A01006 Firmware update for DRIVE-CLiQ component required

Message value: Component number: %1
Message class: General drive fault (19)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

Remedy: Update the firmware using the commissioning tool:

The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.

Firmware update via parameter:

- take the component number from the alarm value and enter into p7828.
- start the firmware download with p7829 = 1.

A01007 POWER ON for DRIVE-CLiQ component required

Message value: Component number: %1
Message class: General drive fault (19)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: A DRIVE-CLiQ component must be switched on again (POWER ON) (e.g. due to a firmware update).

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

Note:

For a component number = 1, a POWER ON of the Control Unit is required.

Remedy: - Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again.

- For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.

A01009 (N) CU: Control module overtemperature

Message value: -
Message class: Overtemperature of the electronic components (6)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.
Remedy: - check the air intake for the Control Unit.

- check the Control Unit fan.

Note:

The alarm is automatically withdrawn once the limit value has been fallen below.

F01010 Drive type unknown

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: An unknown drive type was found.
Fault value (r0949, interpret decimal):
Drive object number (refer to p0101, p0107).
Remedy: - replace Power Module.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

F01011 (N) Download interrupted

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The project download was interrupted.
Fault value (r0949, interpret decimal):
1: The user prematurely interrupted the project download.
2: The communication cable was interrupted (e.g. cable breakage, cable withdrawn).
3: The project download was prematurely exited by the commissioning tool.
100: Different versions between the firmware version and project files which were loaded by loading into the file system "Download from memory card".
Note:
The response to an interrupted download is the state "first commissioning".
Remedy: - check the communication cable.
- download the project again.
- boot from previously saved files (switch-off/switch-on or p0976).
- when loading into the file system (download from memory card), use the matching version.
Reaction upon N: NONE

F01012 (N) Project conversion error

Message value: %1
Message class: Hardware/software error (1)
Drive object: SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2 (NONE)
Acknowledge: IMMEDIATELY
Cause: When converting the project of an older firmware version, an error occurred.
Fault value (r0949, interpret decimal):
Parameter number of the parameter causing the error.
For fault value = 600, the following applies:
The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation.
Notice:
Monitoring of the motor temperature is no longer ensured.

Remedy: Check the parameter indicated in the fault value and correctly adjust it accordingly.

For fault value = 600:

Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface.

Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187.

Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188.

Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189.

- if necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly.
- if necessary, upgrade the firmware to a later version.

A01013 CU: Fan operating time reached or exceeded

Message value: %1

Message class: General drive fault (19)

Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC

Component: Control Unit (CU) **Propagation:** LOCAL

Reaction: NONE

Acknowledge: NONE

Cause: The maximum operating time of the fan in the Control Unit has either been reached or exceeded.

Alarm value (r2124, interpret decimal):

0: The maximum fan operating time is 500 hours.

1: The maximum fan operating time has been exceeded (50000 hours).

Remedy: Replace the fan in the Control Unit and reset the operating hours counter to 0 (p3961 = 0).

F01015 Internal software error

Message value: %1

Message class: Hardware/software error (1)

Drive object: All objects

Component: Control Unit (CU) **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: POWER ON

Cause: An internal software error has occurred.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

Remedy:
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

A01016 (F) Firmware changed

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.

Alarm value (r2124, interpret decimal):

0: Checksum of one file is incorrect.

1: File missing.

2: File too many.

3: Incorrect firmware version.

4: Incorrect checksum of the back-up file.

Remedy: For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.

Note:

The file involved can be read out using parameter r9925.

The status of the firmware check is displayed using r9926.

See also: r9925 (Firmware file incorrect), r9926 (Firmware check status)

Reaction upon F: OFF2

A01017 Component lists changed

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: On the memory card, one file in the directory /SIEMENS/SINAMICS/DATA or /ADDON/SINAMICS/DATA has been illegally changed with respect to that supplied from the factory. No changes are permitted in this directory.

Alarm value (r2124, interpret decimal):

zyx dec: x = Problem, y = Directory, z = File name

x = 1: File does not exist.

x = 2: Firmware version of the file does not match the software version.

x = 3: File checksum is incorrect.

y = 0: Directory /SIEMENS/SINAMICS/DATA/

y = 1: Directory /ADDON/SINAMICS/DATA/

z = 10: File THERMMOTMOD.ACX

z = 11: File MAPPING.ACX

z = 12: File LOADGEAR.ACX

z = 13: File MOTRSM.ACX

Remedy: For the file on the memory card involved, restore the status originally supplied from the factory.

A01020 Writing to RAM disk unsuccessful

Message value: -
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: A write access to the internal RAM disk was unsuccessful.
Remedy: Adapt the file size for the system logbook to the internal RAM disk (p9930).
See also: p9930 (System logbook activation)

F01023 Software timeout (internal)

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: An internal software timeout has occurred.
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

F01030 Sign-of-life failure for master control

Message value: -
Message class: Communication error to the higher-level control system (9)
Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: Infeed: OFF1 (NONE, OFF2)
Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Vector: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Hla: OFF3 (NONE, OFF1, OFF2, STOP2)
Acknowledge: IMMEDIATELY
Cause: For active PC master control, no sign-of-life was received within the monitoring time.
The master control was returned to the active BICO interconnection.
Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
The monitoring time is set as follows using the commissioning tool:
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
Notice:
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

F01031 Sign-of-life failure for OFF in REMOTE

Message value: -
Message class: Communication error to the higher-level control system (9)
Drive object: A_INF, B_INF, HLA, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: Infeed: OFF1 (NONE, OFF2)
Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Vector: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Hla: OFF3 (NONE, OFF1, OFF2, STOP2)
Acknowledge: IMMEDIATELY
Cause: With the "OFF in REMOTE" mode active, no sign-of-life was received within 3 seconds.
Remedy: - check the data cable connection at the serial interface for the Control Unit (CU) and operator panel.
- check the data cable between the Control Unit and operator panel.

A01032 (F) ACX: all parameters must be saved

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The parameters of an individual drive object were saved (p0971 = 1), although there is still no backup of all drive system parameters.
The saved object-specific parameters are not loaded the next time that the system powers up.
For the system to successfully power up, all of the parameters must have been completely backed up.
Alarm value (r2124, interpret decimal):
Only for internal Siemens troubleshooting.
See also: p0971 (Save drive object parameters)
Remedy: Save all parameters (p0977 = 1 or "copy RAM to ROM").
See also: p0977 (Save all parameters)

Remedy: - use the current version of the commissioning tool.

- modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).

- change the drive state (is a drive rotating or is there a message/signal?).

- carefully note any other active messages/signals and remove their cause (e.g. correct any incorrectly set parameters).

- automatically calculate the control parameters (p0340). Then set p0010 = 0.

- boot from previously saved files (switch-off/switch-on or p0976).

- before a new download, restore the factory setting if the know-how protection was not activated on all drive objects.

Cause: An error was detected when evaluating the parameter files PSxxxyyy.ACX, PTxxxyyy.ACX, CAxxxyyy.ACX, or CCxxxyyy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted. Also see r9406 up to r9408.

Alarm value (r2124, interpret hexadecimal):

Remedy: - check the parameters displayed in r9406 up to r9408, and correct these if required.

- Restore the factory setting using (p0976 = 1) and re-load the project into the drive unit.

Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and the alarm is withdrawn.

Note:

As long as this fault is present, it is not possible to save the parameters (p0971, p0977).

See also: r9976 (System utilization)

Remedy: For fault value = 1, 5:

- remove drive objects from the target topology.
- note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology.

When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies:

- the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS).
- if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001).
- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

F01068 CU: Data memory memory overflow

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The utilization for a data memory area is too large.
Fault value (r0949, interpret binary):
Bit 0 = 1: High-speed data memory 1 overloaded
Bit 1 = 1: High-speed data memory 2 overloaded
Bit 2 = 1: High-speed data memory 3 overloaded
Bit 3 = 1: High-speed data memory 4 overloaded
Remedy: - deactivate the function module.
- deactivate drive object.
- remove the drive object from the target topology.

A01069 Parameter backup and device incompatible

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The parameter backup on the memory card and the drive unit do not match.
The module boots with the factory settings.
Example:
Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.
Remedy: - insert a memory card with compatible parameter backup and carry out a POWER ON.
- insert a memory card without parameter backup and carry out a POWER ON.
- save the parameters (p0977 = 1).

F01070 Project/firmware is being downloaded to the memory card

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: A_INF, B_INF, CU_LINK, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, CU_S150_DP, CU_S150_PN, ENC, HLA, HUB, R_INF, S_INF, SERVO, SERVO_AC, SERVO_I_AC, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: An upgrade (project/firmware download) was initiated on the memory card.
While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated.
Caution:
During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit.
If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.
Remedy: Not necessary.
The fault is automatically withdrawn after the upgrade has been completed.

F01072 Memory card restored from the backup copy

Message value: -
Message class: General drive fault (19)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective.

After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.

Remedy: Check that the firmware and parameterization is up-to-date.

A01073 (N) POWER ON required for backup copy on memory card

Message value: -
Message class: General drive fault (19)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The parameter assignment on the visible partition of the memory card has changed.

In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.

Note:

It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).

Remedy: - carry out a POWER ON (switch-off/switch-on) for the Control Unit.

- carry out a hardware reset (RESET button, p0972).

Cause:

When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified.

Alarm value (r2124, interpret decimal):

1: Value lower than minimum value.

2: Value higher than maximum value.

3: Value not a multiple of 1.25 µs.

4: Value does not match isochronous PROFIBUS operation.

5: Value not a multiple of 125 µs.

6: Value not a multiple of 250 µs.

7: Value not a multiple of 375 µs.

8: Value not a multiple of 400 µs.

10: Special restriction of the drive object violated.

20: On a SERVO with a sampling time of 62.5 µs, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted).

21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account).

30: Value less than 31.25 µs.

31: Value less than 62.5 µs (31.25 µs is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).

32: Value less than 125 µs.

33: Value less than 250 µs.

40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs. Further, none of the nodes has a sampling time of less than 125 µs.

41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 µs.

42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 µs.

43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.

44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).

45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5 µs or 187.5 µs (for a 2x or 3x parallel connection).

46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.

52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 µs.

54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 µs.

56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs.

58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 µs.

99: Inconsistency of cross drive objects detected.

116: Recommended clock cycle in r0116[0...1].

General note:
The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).
The parameters of the sampling times can also be changed with automatic calculations.
Example for highest common denominator: 125 s, 125 μs, 62.5 μs --> 62.5 μs

Remedy: - check the DRIVE-CLiQ cables.
- set a valid sampling time.

3: Resulting sampling time is not a multiple of 1.25 μs.
4: Value does not match isochronous PROFIBUS operation.
10: Special restriction of the drive object violated.
99: Inconsistency of cross drive objects detected.
116: Recommended clock cycle in r0116[0...1].
Remedy: Set a valid pulse frequency.

A01251 CU: CU-EEPROM incorrect read-write data

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: Error when reading the read-write data of the EEPROM in the Control Unit.
Alarm value (r2124, interpret decimal):
Only for internal Siemens troubleshooting.

Remedy: For alarm value r2124 < 256, the following applies:
- carry out a POWER ON (switch-off/switch-on).
- replace the Control Unit.

For alarm value r2124 >= 256, the following applies:
- for the drive object with this alarm, clear the fault memory (p0952 = 0).
- as an alternative, clear the fault memory of all drive objects (p2147 = 1).
- replace the Control Unit.

Cause: An error has occurred in the component trace.
The message appears in the following cases:
- upload trace data (p7792 = 1).
- change factory setting (p7790, p7791) for missing property "component trace" (r0193.1 = 0).

Alarm value (r2124, interpret decimal):

1: The DRIVE-CLiQ component does not support the component trace (r0193.1 = 0).

101: Data from trace 1 cannot be read.

102: Data from trace 2 cannot be read.

103: Data from trace 3 cannot be read.

104: Data from trace 4 cannot be read.

105: Data from trace 5 cannot be read.

Remedy: For alarm value = 1:

Upgrade the firmware of the DRIVE-CLiQ component involved.

F01303 Component does not support the required function

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** BICO

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.

Fault value (r0949, interpret decimal):

1: The component does not support the deactivation.

101: The Motor Module does not support an internal armature short-circuit.

102: The Motor Module does not support the deactivation.

201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.

202: The Sensor Module does not support parking/unparking.

203: The Sensor Module does not support the deactivation.

204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.

205: The Sensor Module does not support the selected temperature evaluation (r0458, r0459).

206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.

207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.

208: The Sensor Module does not support de-selection of commutation with zero mark (via p0430.23).

211: The Sensor Module does not support single-track encoders (r0459.10).

212: The Sensor Module does not support LVDT sensors (p4677.0).

213: The Sensor Module does not support the characteristic type (p4662).

214: The power unit does not support the temperature evaluation via PT1000 (r0193).

215: The Terminal Module does not support the temperature evaluation via PT1000

216: The Voltage Sensing Module (VSM) does not support operation with a PT1000 temperature sensor.

Remedy: Upgrade the firmware of the DRIVE-CLiQ component involved.

For fault value = 205, 214, 215:

- check parameter p0600 and p0601 and if required, adapt.

For fault value = 207:

- replace the power unit or if required set the device supply voltage higher (p0210).

For fault value = 208:

- check parameter p0430.23 and reset if necessary.

For fault value = 216:

- check the setting of the sensor type (p3665).
- use a Voltage Sensing module that supports operation with PT1000 (MLFB ...-xxx1).

F01340 Topology: Too many components on one line

Message value: Component number or connection number: %1, fault cause: %2

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** LOCAL

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.

Fault value (r0949, interpret hexadecimal):

xyy hex: x = fault cause, yy = component number or connection number.

1yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all read transfers.

2yy:

The communications clock cycle of the DRIVE-CLiQ connection on the Control Unit is not sufficient for all write transfers.

3yy:

Cyclic communication is fully utilized.

4yy:

The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.

The conditions of operation with a current controller sampling time of 31.25 µs have not been maintained.

5yy:

Internal buffer overflow for net data of a DRIVE-CLiQ connection.

6yy:

Internal buffer overflow for receive data of a DRIVE-CLiQ connection.

7yy:

Internal buffer overflow for send data of a DRIVE-CLiQ connection.

8yy:

The component clock cycles cannot be combined with one another

900:

The lowest common multiple of the clock cycles in the system is too high to be determined.

901:

The lowest common multiple of the clock cycles in the system cannot be generated with the hardware.

Remedy: - check the DRIVE-CLiQ wiring.

- reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ sockets of the Control Unit. This means that communication is uniformly distributed over several lines.

For fault value = 1yy - 4yy in addition:

- increase the sampling times (p0112, p0115, p4099). If necessary, for DCC or FBLOCKS, change the assignment of the run-time group (p21000, p20000) so that the sampling time (r21001, r20001) is increased.

- if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

- reduce the function modules (r0108).

- establish the conditions for operation with a current controller sampling time of 31.25 µs (at the DRIVE-CLiQ line, only operate Motor Modules and Sensor Modules with this sampling time and only use a permitted Sensor Module (e.g. SMC20, this means a 3 at the last position of the Article No.)).

- For an NX, the corresponding Sensor Module for a possibly existing second measuring system should be connected to a free DRIVE-CLiQ socket of the NX.

For fault value = 8yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). Clock cycles on a DRIVE-CLiQ line must be perfect integer multiples of one another. As clock cycle on a line, all clock cycles of all drive objects in the previously mentioned parameters apply, which have components on the line involved.

For fault value = 9yy in addition:

- check the clock cycles settings (p0112, p0115, p4099). The lower the numerical value difference between two clock cycles, the higher the lowest common multiple. This behavior has a significantly stronger influence, the higher the numerical values of the clock cycles.

Pulse enable is withdrawn and prevented.

Remedy: - check the DRIVE-CLiQ wiring.

- reduce the number components on the DRIVE-CLiQ line involved in order to maintain the maximum quantity structure.

F01354 Topology: Actual topology indicates an illegal component

Message value: Fault cause: %1, component number: %2
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The actual topology indicates at least one illegal component.

Fault value (r0949, interpret hexadecimal):

yyxx hex: yy = component number, xx = cause.

xx = 1: Component at this Control Unit not permissible.

xx = 2: Component in combination with another component not permissible.

Note:

Pulse enable is prevented.

Remedy: Remove the illegal components and restart the system.

F01355 Topology: Actual topology changed

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The device target topology (p0099) does not correspond to the device actual topology (r0098).

The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning tool.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

See also: r0098 (Actual device topology), p0099 (Device target topology)

Remedy: One of the following counter-measures can be selected if no faults have occurred in the topology detection itself:

If commissioning is still not completed:

- carry out a self-commissioning routine (starting from p0009 = 1).

In general:

Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107).

Generating servo drives: Set p0097 to 1, set p0009 to 0.

Generating vector drives: Set p0097 to 2, set p0009 to 0.

Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0.

In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).

If commissioning has already been completed:

- re-establish the original connections and re-connect power to the Control Unit.
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.
- change the device parameterization to match the connections (this is only possible using the commissioning tool).

Notice:

Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning tool and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

F01356 Topology: There is a defective DRIVE-CLiQ component

Message value: Fault cause: %1, Component number: %2, Connection number: %3

Message class: Hardware/software error (1)

Drive object: All objects

Component: None **Propagation:** LOCAL

Reaction: NONE (OFF2)

Acknowledge: IMMEDIATELY

Cause: The actual topology indicates at least one defective DRIVE-CLiQ component.

Fault value (r0949, interpret hexadecimal):

zzyyxx hex:

zz = connection number of the component at which the defective component is connected

yy = component number of the component at which the defective component is connected

xx = fault cause

xx = 1: Component at this Control Unit not permissible.

xx = 2: component with communication defect.

Note:

Pulse enable is withdrawn and prevented.

Remedy: Replace the defective component and restart the system.

F01357 Topology: Two Control Units identified on the DRIVE-CLiQ line

Message value: component number: %1, connection number: %2

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** LOCAL

Reaction: NONE (OFF2)

Acknowledge: IMMEDIATELY

Cause: In the actual topology, 2 Control Units are connected with one another through DRIVE-CLiQ.

As standard, this is not permitted.

This is only permitted if the Technology Extension OALINK has already been installed on the two Control Units and has been commissioned online.

Fault value (r0949, interpret hexadecimal):

yyxx hex:

yy = connection number of the Control Unit at which the second Control Unit is connected

xx = component number of the Control Unit at which the second Control Unit is connected

Note:

Pulse enable is withdrawn and prevented.

Remedy: In general:

- remove the connection to the second Control Unit and restart.
- for the S120M component DRIVE-CLiQ extension, interchange the hybrid cable (IN/OUT).

When using OALINK:

- remove the DRIVE-CLiQ connection and restart the systems.
- install OALINK on both Control Units and activate.
- Check the configuration of the DRIVE-CLiQ sockets in OALINK.

A01358 Topology: Line termination not available

Message value: CU connection number: %1, component number: %2, connection number: %3
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: At least one line with distributed drives is not terminated. The last participant on the line must be terminated with a line termination connector.
This therefore ensures the degree of protection of the distributed drives.
Alarm value (r2124, interpret hexadecimal):
zzyyxx hex:
zz = connection number of the distributed drive with missing termination connector
yy = component number
xx = CU connection number
Remedy: Install the line terminating connector for the last distributed drive.

F01359 Topology: DRIVE-CLiQ performance not sufficient

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The DRIVE-CLiQ performance is not sufficient at one line in order to identify an inserted component.
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (switch-off/switch-on).
- Distribute components across several DRIVE-CLiQ lines.
Note:
For this topology, do not withdraw and insert components in operation.

F01360 Topology: Actual topology not permissible

Message value: Fault cause: %1, preliminary component number: %2
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects

aa = 08 hex = 8 dec:
A component was connected to a Control Unit that is not permitted for this purpose.
aa = 09 hex = 9 dec:
A component was connected to a Control Unit with out-of-date firmware.
aa = 0A hex = 10 dec:
Too many components of a particular type detected.
aa = 0B hex = 11 dec:
Too many components of a particular type detected on a single line.
Note:
The drive system is no longer booted. In this state, the drive control (closed-loop) cannot be enabled.

Remedy: For fault cause = 1:
Change the configuration. Connect less than 199 components to the Control Unit.
For fault cause = 2:
Remove the component with unknown component type.
For fault cause = 3, 4, 5:
Establish a valid combination.
For fault cause = 6, 7:
Connect the expansion module directly to a permitted Control Unit.
For fault cause = 8:
Remove component or use a permissible component.
For fault cause = 9:
Upgrade the firmware of the Control Unit to a later version.
For fault cause = 10, 11:
Reduce the number of components.

A01361 Topology: Actual topology contains SINUMERIK and SIMOTION components

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE

An NX10 or NX15 was connected to a SIMOTION control.
cc = 02 hex = 2 dec:
A CX32 was connected to a SINUMERIK control.

Remedy: For alarm value = 1:
Replace all NX10 or NX15 by a CX32.
For alarm value = 2:
Replace all CX32 by an NX10 or NX15.

A01362 Topology: Topology rule(s) broken

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: At least one topology rule for the SINAMICS S120 Combi has been broken.

In the event of a fault, the ramping up of the drive system is aborted and closed-loop drive control is not enabled.

Alarm value (r2124, interpret decimal):

The alarm value indicates which rule has been violated.

1: The S120 Combi may only be wired via DRIVE-CLiQ socket X200 to X100 on the NCU.

2: Only one Single Motor Module (SMM) or one Double Motor Module (DMM) may be connected via X200 to the DRIVE-CLiQ socket X101 on the NCU.

3: Only one Terminal Module 54F (TM54F) or one DRIVE-CLiQ Hub Module (Hub) may be connected via X500 to the DRIVE-CLiQ socket X102 on the NCU.

4: Only Sensor Modules may be connected to DRIVE-CLiQ sockets X201 up to X203 (3-axis) or X204 (4-axis) on the S120 Combi.

5: Only one Sensor Module, type SMC20 or SME20 may be connected to DRIVE-CLiQ socket X205 (X204 is not available for 3-axis).

6: If a Single Motor Module is being used as the first expansion axis, only one more Single Motor Module may be connected (via X200 to X201 on the first Single Motor Module).

7: Only Sensor Modules may be connected to the corresponding DRIVE-CLiQ socket X202 on any Single Motor Modules which may be present.

8: For a second Single Motor Module or for a Double Motor Module, it is not permissible to connect anything at X201.

9: If a Double Motor Module is used as an expansion axis, only Sensor Modules may be connected to X202 and X203.

10: If a Terminal Module 54F (TM54F) is configured, only one DRIVE-CLiQ Hub Module (DMC20, DME20) may be connected to X501 of the TM54F module via DRIVE-CLiQ socket X500.

11: On the DRIVE-CLiQ Hub Module, only Sensor Modules Cabinet (SMC) and Sensor Modules External (SME) may be connected to X501 through X505.

12: Only certain Motor Modules may be used for expansion axes.

13: For an S120 Combi with 3 axes, nothing must be connected at the DRIVE-CLiQ Hub Module at X503.

Remedy: Evaluate the alarm value and ensure compliance with the corresponding topology rule(s).

Message value: Parameter: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** BICO
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.

An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different.

Example 1:

BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.

p2002: contains the reference value for current

p2001: contains the reference value for voltage

Example 2:

BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input.

p2001: contains the reference value for voltage, drive objects 1, 2

6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.

6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

Remedy: For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the EP terminal at the Motor Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1900, 1901, 1902:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Control Unit software.
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003, 2004, 2005:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F_Source_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F_WD_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:
- check the settings of the values for the F parameters and, if required, correct.
The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:
F_CRC_Length = 2-byte CRC and F_Par_Version = 0
F_CRC_Length = 3-byte CRC and F_Par_Version = 1
For fault value = 6165:
- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- check whether all F parameters of the drive match the F parameters of the F host.
For fault value = 6166:
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

F01640 (N, A) SI P1 (CU): component replacement identified and acknowledgment/save required

Message value: Fault cause: %1
Message class: General drive fault (19)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: "Safety Integrated" has identified that a component has been replaced.
It is no longer possible to operate the particular drive without fault.
When safety functions are active, after a component has been replaced it is necessary to carry out a partial acceptance test.
Fault value (r0949, interpret binary):
Bit 0 = 1:
It has been identified that the Control Unit has been replaced.
Bit 1 = 1:
It has been identified that the Motor Module/Hydraulic Module has been replaced.
Bit 2 = 1:
It has been identified that the Power Module has been replaced.
Bit 3 = 1:
It has been identified that the Sensor Module channel 1 has been replaced.
Bit 4 = 1:
It has been identified that the Sensor Module channel 2 has been replaced.
Bit 5 = 1:
It has been identified that the sensor channel 1 has been replaced.
Bit 6 = 1:
It has been identified that sensor channel 2 has been replaced.

Remedy: - acknowledge component replacement (p9702 = 29).
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
- acknowledge fault (e.g. binector input p2103).

108:
- the parameterized actual value sensing clock cycle cannot be set on this component

109:

- if the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle (p9511) and the current controller clock cycle (p0115[0]) must be identical.

- SINAMICS S110: if the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle p9511 must be = 250 µs.

110:

- the actual value sensing clock cycle (p9511) for safety with encoder (p9506 = 0) is less than 2 ms for this Control Unit (e.g. CU305).

111:

- the monitoring clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

112:

- An actual value sensing clock cycle p9511 = 0 on a drive object of a Double Motor Module is not permissible in the existing configuration.

200, 201:

- S120M: the monitoring clock cycle cannot be maintained as a result of the conditions required in the system.

202:

- the current controller sampling time is set to zero (p0115[0]).

Remedy: For enabled SI monitoring integrated in the drive (p9601/p9801 > 0):

- upgrade the firmware of the Control Unit to a later version.

For enabled motion monitoring function (p9501 > 0):

- correct the monitoring clock cycle (p9500) and carry out POWER ON.

For fault value = 100:

- for S120M, set the actual value sensing clock cycle to p9511 = 0.

For fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).

- for motion monitoring functions integrated in the drive (p9601/p9801bit 2 = 1) the actual value sensing clock cycle can be directly parameterized in p9511/p9311.

- SINAMICS S120M: set the monitoring clock cycle (p9500) to an integer multiple of 2 ms.

For fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.

- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.

- increase the DP clock cycle for operation with an isochronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.

- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500/p9300).

For fault value = 107:

- set an actual value sensing clock cycle that matches the current controller clock cycle (p9511 >= 4 * p0115[0], 8 * p0115[0]) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.

- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).

- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p0115[0]).

- SINAMICS S110: set the actual value sensing clock cycle to p9511 = 250 µs.

For fault value = 110:

- set the actual value sensing clock cycle in p9511 to 2 ms or higher.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

For fault value = 200, 201:

- increase the current controller sampling time (p0115[0]).
- if required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.

- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).

- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

F01653 SI P1 (CU): PROFIBUS/PROFINET configuration error

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: NONE (OFF1, OFF2, OFF3)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: There is a PROFIBUS/PROFINET configuration error for using Safety Integrated monitoring functions with a higher-level control (SINUMERIK or F-PLC).

Note:

For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

200: A safety slot for receive data from the control has not been configured.

210, 220: The configured safety slot for the receive data from the control has an unknown format.

230: The configured safety slot for the receive data from the F-PLC has the incorrect length.

231: The configured safety slot for the receive data from the F-PLC has the incorrect length.

240: The configured safety slot for the receive data from the SINUMERIK has the incorrect length.

250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive.

300: A safety slot for the send data to the control has not been configured.

310, 320: The configured safety slot for the send data to the control has an unknown format.

330: The configured safety slot for the send data to the F-PLC has the incorrect length.

331: The configured safety slot for the send data to the F-PLC has the incorrect length.

340: The configured safety slot for the send data to the SINUMERIK has the incorrect length.

400: The telegram number in the F-PLC does not match the parameterization in the drive.

Remedy: The following generally applies:

- check and, if necessary, correct the PROFIBUS/PROFINET configuration of the safety slot on the master side.
- upgrade the Control Unit software.

For fault value = 250:

- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.

For fault value = 231, 331:

- in the drive, parameterize the appropriate PROFIsafe telegram (p9611/p9811) to be set on the F-PLC and to be set in p60022.
- Configure the PROFIsafe telegram matching the parameterization (p9611/p9811) in the F-PLC.

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The configuration of a PROFIsafe telegram in the higher-level control (F-PLC) does not match the parameterization in the drive.

Note:

This message does not result in a safety stop response.

Alarm value (r2124, interpret decimal):

1:

A PROFIsafe telegram is configured in the higher-level control, however PROFIsafe is not enabled in the drive (p9601.3).

2:

PROFIsafe is parameterized in the drive; however, a PROFIsafe telegram has not been configured in the higher-level control.

Remedy: The following generally applies:
- check and, if necessary, correct the PROFIsafe configuration in the higher-level control.
For alarm value = 1:
- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.
For alarm value = 2:
- configure the PROFIsafe telegram to match the parameterization in the higher-level F-control.

F01655 SI P1 (CU): Align monitoring functions

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: An error has occurred when aligning the Safety Integrated monitoring functions of both monitoring channels. No common set of supported SI monitoring functions was able to be determined.
- there is either a DRIVE-CLiQ communication error or communication has failed.
- Safety Integrated software releases on the Control Unit and Motor Module/Hydraulic Module are not compatible with one another.
Note:
This fault results in a STOP A that cannot be acknowledged.
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.

Remedy: - carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module/Hydraulic Module software.
- upgrade the Control Unit software.
- check the electrical cabinet design and cable routing for EMC compliance

F01656 SI CU: Parameter monitoring channel 2 error

Message value: %1
Message class: Hardware/software error (1)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: When accessing the Safety Integrated parameters for monitoring channel 2 in the non-volatile memory, an error has occurred.
Note:
This fault results in a STOP A that can be acknowledged.
Fault value (r0949, interpret decimal):
129:
- safety parameters for monitoring channel 2 corrupted.
- drive with enabled safety functions was possibly copied offline using the commissioning tool and the project downloaded.
131: Internal Motor Module/Hydraulic Module software error.
132: Communication errors when uploading or downloading the safety parameters for monitoring channel 2.
255: Internal software error on the Control Unit.

Remedy: - re-commission the safety functions.
- upgrade the Control Unit software.
- upgrade the Motor Module/Hydraulic Module software.
- replace the memory card or Control Unit.
For fault value = 129:
- activate the safety commissioning mode (p0010 = 95).
- adapt the PROFIsafe address (p9610).
- start the copy function for SI parameters (p9700 = D0 hex).
- acknowledge data change (p9701 = DC hex).
- exit the safety commissioning mode (p0010 = 0).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON (switch-off/switch-on) for all components.
For fault value = 132:
- check the electrical cabinet design and cable routing for EMC compliance

F01657 SI P1 (CU): PROFIsafe telegram number invalid

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: POWER ON
Cause: The PROFIsafe telegram number set in p9611 is not valid.
When PROFIsafe is enabled (p9601.3 = 1), then a telegram number greater than zero must be entered in p9611.
Note:
This fault does not result in a safety stop response.
See also: p9611 (SI PROFIsafe telegram selection (Control Unit)), p60022 (PROFIsafe telegram selection)
Remedy: Check the telegram number setting (p9611).

F01658 SI P1 (CU): PROFIsafe telegram number differ

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: HLA, SERVO, SERVO_AC, SERVO_I_AC, VECTOR, VECTOR_AC, VECTOR_I_AC
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The PROFIsafe telegram number is set differently in p9611 and p60022.
For p9611 not equal to 998, the following applies:
The telegram number must be identically set in both parameters.
The following applies for p9611 = 998:
As a result of the compatibility to firmware versions < 4.5, then only the values 0 and 30 are permitted in p60022.
Note:
This fault does not result in a safety stop response.
See also: p9611 (SI PROFIsafe telegram selection (Control Unit)), p60022 (PROFIsafe telegram selection)
Remedy: Match the telegram number in both parameters so that they are the same (p9611, p60022).

F01659	**SI P1 (CU): Write request for parameter rejected**
Message value:	%1

Component:	None **Propagation:** GLOBAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)

Cause:

The write request for one or several Safety Integrated parameters on the Control Unit (CU) was rejected.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

1: The Safety Integrated password is not set.

2: A reset of the drive parameters was selected. However, the Safety Integrated parameters were not reset, as Safety Integrated is presently enabled.

3: The interconnected STO input is in the simulation mode.

10: An attempt was made to enable the STO function although this cannot be supported.

11: An attempt was made to enable the SBC function although this cannot be supported.

12: An attempt was made to enable the SBC function although this cannot be supported for a parallel circuit configuration (r9871.14).

13: An attempt was made to enable the SS1 function although this cannot be supported.

14: An attempt was made to enable the PROFIsafe communication - although this cannot be supported or the version of the PROFIsafe driver used on both monitoring channels is different.

15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.

16: An attempt was made to enable the STO function although this cannot be supported when the internal voltage protection (p1231) is enabled.

17: An attempt was made to enable the PROFIsafe function although this cannot be supported for a parallel circuit configuration.

18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.

19: An attempt was made to enable the SBA (Safe Brake Adapter), although this cannot be supported.

20: An attempt was made to enable the motion monitoring functions integrated in the drive and the STO function, both controlled via F-DI.

21: An attempt was made to enable the motion monitoring functions integrated in the drive for a parallel connection, although these cannot be supported.

22: An attempt was made to enable the Safety Integrated functions although these cannot be supported by the connected Power Module.

23: For ESR, an attempt was made to enable the delay of STO, although this cannot be supported.

24: An attempt was made to enable the SBC function, although no power unit data set is set for the brake control (p7015 = 99).

25: An attempt was made to parameterize a PROFIsafe telegram although this cannot be supported.

26: With the selected signal source for STO/SS1, an attempt was made to activate the simulation mode.

27: An attempt was made to activate the Basic Functions by controlling via TM54F although this cannot be supported.

28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported.

29: An attempt was made to parameterize the STOP B as stop response for PROFIsafe failure, although this cannot be supported.

9612: An attempt was made to parameterize STOP B as stop response for PROFIsafe failure, although PROFIsafe is not enabled.

Remedy: For fault value = 1:
- set the Safety Integrated password (p9761).
For fault value = 2:
- inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.
For fault value = 3:
- end the simulation mode for the digital input (p0795).
For fault value = 10, 11, 12, 13, 14, 15, 17, 18, 19, 21, 22, 23, 27:
- check whether there are faults in the safety function alignment between the two monitoring channels (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
For fault value = 16:
- inhibit the internal voltage protection (p1231).
For fault value = 20:
- correct the enable setting (p9601).
For fault value = 22:
- use a Power Module that supports the Safety Integrated functions.
For fault value = 24:
- set the power unit data set for the holding brake (p7015).
For fault value = 25:
- use a Power Module that supports the PROFIsafe telegram selection.
- correct the telegram number setting (p9611).
For fault value = 26:
- deactivate the simulation mode for the set signal source for STO/SS1 (p9620) (p0795).
For fault value = 28:
- use the power unit with the feature "STO via terminals at the Power Module".
For fault value = 29:
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- if required, parameterize the stop response for PROFIsafe failure to STOP A (p9612 = p9812 = 0).
For fault value = 33:
- deselect drive integrated motion monitoring without selection (p9601.5, p9801.5) and select safety functions that are supported (see p9771/p9871).
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
